## Abstract

Interactions among peers of the same social network play significant roles in facilitating the adoption and diffusion of modern technologies in poor communities. We conduct a large-scale randomized controlled trial in rural India to identify the impact of information from friends on willingness to pay (WTP) for high-quality and multi-purpose solar lanterns. We offered solar lanterns to seed households from 200 non-electrified villages and randomly assigned three of their friends to two communication treatments (unincentivized and incentivized) that led to different exposure to their seed friend. We also introduce a second treatment to investigate whether the seed's gender impacts the magnitude of peer effects. We show that unincentivized communication increases WTP for solar lanterns by 90% and incentivized communication by 145%, but gender doesn't seem to matter. We also show that learning from others is the mechanism that drives the increase in WTP. Our findings have significant implications for policies that aim at promoting the diffusion of new technologies in developing countries.

## 1 Introduction

Theories of economic growth hold technological progress as the main engine of economic development. In particular, endogenous growth models highlight the important role of social learning in technology diffusion: profit- or utility-maximizing agents invest, learn by doing and learn from each other through knowledge spillovers (Romer 1986; Lucas 1988; Aghion and Howitt 1998; Barro and Sala-i-Martin 2004; Acemoglu 2009). This phenomenon has been especially documented for the diffusion of agricultural technologies in developing countries (Foster and Rosenzweig 1995; Bandiera and Rasul 2006; Bardhan and Udry 1999; Conley and Udry 2010). But peers, or broadly speaking one’s social network, also influence a host of other individual outcomes such as those related to education (Hoxby 2000; Sacerdote 2001; Angrist and Lang 2002; Zimmerman 2003; Figlio 2005), health (e.g., Munshi 2003; Kling and Liebman 2007), political participation (e.g., Fafchamps and Vicente 2013; Fafchamps, Vaz, and Vicente 2020; Nickerson 2008), labor productivity and consumption (e.g., Mobius, Niehaus, and Rosenblat 2005; Mas and Moretti 2009).

In this paper, we conduct a randomized controlled trial to investigate and quantify the magnitude of peer effects on willingness-to-pay (WTP) for a new solar-powered lantern in Uttar Pradesh, India. The solar lanterns are durable, multi-purpose, and convenient to use. They sold for Indian rupees (INR) 1,200 (USD 18.5) in Lucknow, the capital of the state of Uttar Pradesh, at the time of the fieldwork. The lanterns also have a phone-charging feature, which makes them appealing. The study area was still non-electrified, and households did not know about solar lanterns before the study. We randomly selected 200 “seed” individuals, to whom we offered a solar lantern to participate in the study. Each seed household gave three names of close peers (friends or relatives) with whom they regularly interact and we randomly assigned these friends to three groups: a control group, an “unincentivized” communication treatment, and an “incentivized” communication treatment. We interviewed the peers and elicited willingness to pay for the solar lanterns using the Becker-DeGroot-Marschak (BDM) method (Becker, DeGroot, and Marschak 1964) for all three friends, but at different points in time. We elicited WTP from the control group immediately after interviewing the seed household. This allows us to capture WTP when there is no prior knowledge of what lanterns are and how to use them. We elicited WTP for both the unincentivized and incentivized groups thirty days after the seed received the lantern. Friends in the incentivized group, however, were invited to a “tea meeting,” during which the seed presented the solar lantern and shared his or her experience. We elicited WTP from this group right after the tea meeting.

Our experimental design exploits the time lags to instrument for the possibility that peers exchange

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. information about solar lanterns. Within thirty days, peers in the “unincentivized” treatment group have

likely talked to their seed friend, who may have mentioned or even demonstrated the lantern’s use. We also introduce a second treatment, the gender of the original seed: out of the 200 individuals, half are male and half female. Recent empirical research has documented that the social identity of the person who carries and diffuses information can have a critical influence on how such information is understood or interpreted. In the context of technology adoption, this means that potential adopters are more susceptible to information and advice from some communicators rather than others (BenYishay and Mobarak 2019). A key determinant seems to be whether communicators and receivers share a common group identity. In India, gender roles structure a large part of social life (OECD 2020; Deininger, Goyal, and Nagarajan 2013; Roy 2015; Kandpal and Baylis 2019). Therefore, we investigate whether women may be less effective communicators, especially when it comes to transmitting information about new technologies. Before fieldwork, the research project was approved by the Internal Review Board (IRB) of Columbia University, and a complete pre-analysis plan, describing the main hypotheses to be tested, the experimental set-up and the identification strategy, was posted in a public registry.

The results suggest that both the “unincentivized” and “incentivized” treatments have large effects on WTP for solar lanterns. In contrast, the gender treatment is not statistically significant at conventional levels (although the point estimate is negative). Specifically, we find that the unincentivized treatment group is willing to pay INR 120 more than the control group. The incentivized group, on the other hand, is willing to pay INR 190 more than the control group. These treatment effects correspond to 90% and 145% increases, respectively. It is notable that the unincentivized treatment almost doubled WTP, whereas the incentivized treatment added another 55 percentage points.

This paper contributes to the development economics literature on the role of communication and social learning in adoption and diffusion of new technologies. Important research in this strand of literature uses theories of social learning to model adoption and diffusion of mostly agricultural technologies (Foster and Rosenzweig 1995; Bardhan and Udry 1999; Bandiera and Rasul 2006; Conley and Udry 2010).<sup>1</sup> A particularly important observation in this literature is that modern agricultural technologies significantly improve agricultural output and welfare, but their adoption or uptake rate has been disappointingly low. It demonstrates that farmers engage in learning-by-doing and learning from others. Indeed, adoption by one farmer generates knowledge to all her peers and increases their expected yield (Foster and Rosenzweig 1995;

---

1. Studies on social learning outside agricultural set-ups in developing countries include, Oster and Thornton (2012) on adoption of menstrual cups by school girls in Nepal, and Jain and Kapoor (2015) on academic achievement by university students in India.

Bardhan and Udry (1999). The adoption of new agricultural technologies, therefore, is a social process.

More recently, BenYishay and Mobarak (2019) extend this fundamental theory of social learning and show that farmers are more likely to adopt new technologies if they share the social identity of the person who communicates information about the new technology. Using a randomized controlled trial in Malawi, they investigated whether the provision of performance-based rewards to those who communicate about the technology results in increased diffusion of the technology. They found that technology adoption was much more likely when the information was provided by “peer” farmers (i.e., farmers with characteristics similar to those of the respondents), as opposed to government-employed extension workers or “lead” farmers (i.e., farmers with high income or running larger-scale farming operations). In a similar set-up in northern Uganda, Shikuku et al. (2019) designed a randomized controlled trial to shed light on what motivates farmers to communicate information about new technologies to their peers. They differentiate between altruistic motives, social recognition motives, and private rewards. Shikuku et al. (2019) found that offering private reward is indeed effective, but providing the same reward by publicly acknowledging the efforts of the information communicator farmer (the social recognition motive) leads to a higher tendency to experiment and increase effort to diffuse information. In a separate experimental study in the same area, Sseruyange and Bulte (2018) also document that provision of monetary incentives to peers significantly promotes diffusion of information about new technologies.

We build on BenYishay and Mobarak (2019) and Shikuku et al. (2019) and use a novel technology (a solar lantern) to disentangle the impact of learning through incentivized and well-targeted communication from learning through unincentivized and regular communication of peers on adoption and willingness-to-pay for the technology. A solar lantern is a superior lighting technology, which has the potential to improve the welfare of all members of the household. Unlike agricultural technologies, which involve significant uncertainty, are sensitive to specific agro-ecological conditions, and require a long time to capture their payoff, the solar lanterns we consider are easy to operate, and users quickly learn about their benefits. Our design also allows us to aggregate revealed WTP, a figure important for policymakers and other stakeholders to design optimal subsidy and cost reduction strategies to encourage the diffusion of the technology in cases when average WTP is lower than average cost.

The major challenge in identifying the impact of information from social network members on the adoption of new technologies, even after tackling identification issues through a randomized assignment, is understanding the mechanisms that drive the observed results. It may be that neighbors like to imitate each other rather than learn from each other about the benefits of the new technology or about how to operate it (Oster

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. and Thornton 2012). We collected detailed information about respondents’ perceptions of the solar lanterns

as well as gender norms. In particular, we find evidence that the increase in WTP is driven both by learning how to operate the technology and learning about its benefits. We also document that households in our sample appeared to give women some say in purchasing decisions or when it comes to using new products. In particular, most respondents thought that women were as able as men to use new technologies. Consequently, despite their lower overall social status, women may still be perceived as legitimate communicators when it comes to demonstrating the pros and cons of household durables such as solar lanterns.

The paper also speaks to the emerging literature on electrification and energy transition in developing countries (Dinkelman 2011; Dugoua and Urpelainen 2014; Furukawa 2014; Grimm et al. 2016; Lee et al. 2016a; Lee, Miguel, and Wolfram 2016b). The current level of electrification in developing regions, such as Sub-Saharan Africa, South Asia, and Latin America, remains low (International Energy Agency 2014).<sup>2</sup> Extending the grid to all rural areas requires high levels of investment that are often difficult to secure by governments. Households in poor communities regularly use kerosene lamps to meet lighting needs. In rural India, this is the case for about half of the population (Jain et al. 2018).

Yet, kerosene lamps generate indoor air pollution, which adversely affects health outcomes, pose risk of burns and fires, and require rural households to regularly travel long distances to buy fuel (Lam et al. 2012). We conduct a cost-benefit analysis and show that, if households adopt the solar lantern, they could save about INR 576 per year on kerosene spending and they could amortize the full cost of the lantern in just over two years. Kerosene lamps also emit harmful greenhouse gases. UNEP (2013) estimated that the substitution of solar lighting for all traditional lighting in India would save about 34 million tonnes of carbon dioxide annually. In the Indian context, kerosene use also has a significant impact on public finances due to the long history of generous subsidies. Every consumer switching from kerosene to solar lanterns would save the government about INR 600 per year (Jain and Ramji 2016). Solar-powered lighting equipment, therefore, holds the promise of reducing indoor air pollution and greenhouse gas emissions, while improving household and public finances. Given the mounting pressures from the international community to see progress on climate action, transition to solar technologies offers exciting opportunities. From a public policy point of view, this paper offers insights on how to facilitate this transition.

The rest of the paper is organized as follows. Section 2 lays out the conceptual framework and the key hypotheses about willingness to pay for solar lanterns. Section 3 describes the design and experimental procedure, including randomization checks. Section 4 presents the empirical results, mechanism and cost-

benefit analysis. Section 5 discusses the key experimental design related issues, and section 6 concludes the paper.

## 2 Conceptual Framework

Drawing on the key papers on social learning in development economics (Foster and Rosenzweig 1995; Bardhan and Udry 1999; Bandiera and Rasul 2006; Conley and Udry 2010; BenYishay and Mobarak 2019), we lay out a brief motivating framework for interpreting the main results of our randomized controlled trial. We begin by defining the following treatments:

- In the *unincentivized* group, subjects observe the new technology being used by their peers without incentivized communication. Learning from others is the result of natural interactions through social networks and the seed household.
- In the *incentivized* group, subjects observe the new technology being used by their peers, and are directly informed about its properties just before WTP is elicited. Thus, learning from others is the result of both the natural and incentivized interactions with the seed household.

In the context of agricultural technologies, previous studies have used the “target-input” model proposed by Wilson (1975) and Jovanovic and Nyarko (1994) to test for the presence of social learning. According to this model, farmers know the basic form of the new technology with certainty (e.g., an improved seed), but do not know precisely how to use it (e.g., the quantity of seeds or the amount of fertilizer to use). Farmers learn about the new technology over time through learning-by-doing. They try different levels of input and observe the realized output. Farmers can also learn from each other if they belong to the same social network and share information (or costlessly observe each other’s input choice). In this model, the diffusion of new technologies is a social process because adoption by an individual generates information that spills over to all her peers and increases their expected welfare in the future (Bardhan and Udry 1999).

Solar lanterns are much simpler to use than agricultural technologies, but the primary mechanism remains that users learn about the product through learning-by-doing and through learning-from-others. When users first see solar lanterns, they quickly understand that they need solar exposure to generate light. However, several aspects of the product will be uncertain, such as how long it takes to charge and the duration of the batteries. Lighting quality will also be difficult to ascertain before prolonged usage. A critical aspect is whether luminosity remains stable over time, especially relative to kerosene lamps, which are the default lamps used by households in the region. Scope for misuse also exists on how to position the lantern in the

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press, sun for optimal charging and how to maintain the photovoltaic panels over time. Regular cleaning of the panels is essential to ensure that dirt, grime, bird droppings, and debris do not block the sun, while avoiding any abrasive contact not to scratch the glass accidentally.

We model the diffusion of solar lanterns using the social learning framework. Peers learn about the service provided by the lanterns and update their beliefs about its quality through their interactions with the seed households. Our hypothesis is that they become more willing to pay for lanterns as a result. The experimental design leaves one month for information to diffuse, that is, for households in the unincentivized group to learn about the solar lantern.<sup>3</sup> In our context, one month seems sufficient because 1) the technology is easily observable, and 2) we offer the technology to one of their closest friends, with whom they interact regularly. We will show later that, indeed, all households in the “unincentivized” treatment group report knowing what a solar lantern is, indicating that one month was sufficient to ensure respondents in the treatment groups were exposed to solar lanterns through their friend. Hence, we formulate Hypothesis 1 as follows:

**Hypothesis 1.** *The unincentivized treatment increases willingness to pay.*

An appealing extension of the “target-input” model, developed by BenYishay and Mobarak (2019), accounts for how information travels through social networks, specifically focusing on the role of “communicators” (the members of the social network who communicate information about the new technology). Only communicators know the optimal level of the technology and it is costly to transfer such knowledge to others. Technology diffusion may occur faster if communicators are rewarded for each new person adopting the technology due to their efforts. In our case, we asked seed households to invite their randomly selected peer for tea, after about one month of using the solar lantern. We expect tea meetings to increase the salience of the product and provide more accurate information than in the case of unincentivized regular interactions. Consequently, we hypothesize that the peers who attend a tea meeting are more willing to pay for the lanterns than the peers who do not attend a tea meeting. We formulate Hypothesis 2 as follows:

**Hypothesis 2.** *The incentivized communication treatment increases willingness to pay more than the unincentivized communication treatment.*

Finally, BenYishay and Mobarak (2019) show that, when it comes to adopting new technologies, farmers appear most convinced by communicators with whom they share a group identity. In our study, the social identity we focus on is gender because gender norms in India assign women to a remarkably low social status. Peers may, therefore, capture the knowledge that women generate through their experience with solar lanterns

---

3. Allowing for longer than a month would increase the probability of other confounders.

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. less effectively. Previous studies have documented that women are less influential than men. For example,

although in a context very different from ours, Aral and Walker (2012) use randomized experiments on 1.3 million Facebook users to show that men are more influential than women and that women influence men more than they influence other women.

In India, women’s lower social status is apparent in the lower educational attainment levels and lower labor market participation. Gender inequalities are also pervasive inside the household, where women display lower bargaining power over many household decisions, such as wealth inheritance or the purchase of durable goods (Deininger et al. 2013; Roy 2015; Kandpal and Baylis 2019). In similar contexts, studies have shown that improved cookstoves are adopted less than optimally, because women have low decision-making power (Miller and Mobarak 2013; Alem, Hassen, and Köhlin 2017). Hence, inside or outside the household, women lack social prestige. We, therefore, hypothesize that, when women communicate about a new technology, receivers of the information are likely to pay less attention or to discount the information they receive. This implies that the effect of our communication treatments on WTP would be weaker when the seed is female. This leads to our third hypothesis:

**Hypothesis 3.** *Learning through male social networks increases willingness to pay by a greater amount than learning through female social networks.*

The objective of this paper is to quantify the impact of unincentivized and incentivized communication regarding a new technology on WTP by peers.<sup>4</sup> Although the treatment effects have significant implications on social learning and the adoption of new technologies throughout networks, our scope is limited to identifying learning about the technology by close members in the social network. Nonetheless, we attempt to draw on theories of social learning to explain some of the mechanisms behind our results in Section 4.

---

4. When analyzing the diffusion of information, it is often valuable to understand how information spreads across large distances within the network. The two notable models used in the literature to explain learning within social networks are the Bayesian model and the non-Bayesian types of models, which mainly constitute the DeGroot model (DeGroot 1974). Bayesian learning assumes agents update their beliefs about the different states of the world using Bayes’ rule. In contrast, in the Degroot model, each agent receives a noisy independent signal from a true state of the world and repeatedly transmits information to other agents. To update their own belief, DeGroot-type agents evaluate the weighted average of their neighbor’s opinions. More recently, Li and Tan (2020) and Chandrasekhar, Larreguy, and Xandri (2020) proposed new models of social learning. Li and Tan (2020) propose a variant of the Bayesian model of learning from local networks consisting of the agent’s neighbors and the links among them. The agent is assumed to believe that her local network is the entire network. Then, the authors formulate a tractable learning rule to demonstrate what they call “locally Bayesian learning”, under which new information is extracted by each agent using the full history of observed reports in the agent’s local network. Chandrasekhar et al. (2020) on the other hand consider a model of incomplete information where members can be either Bayesian or Degroot, and where members have information about the proportion of the two types. The authors validate their model using experiments and find that the percentage of Bayesian members in a network varies substantially with the empirical context.

### 3 Experimental Design

#### 3.1 Product, Sampling and Treatments

To test our hypotheses, we collaborated with a local organization known as MORSEL India to distribute solar lanterns and conduct a randomized controlled experiment<sup>5</sup> in 200 non-electrified habitations<sup>6</sup> in rural India. We chose the Gonda district in the state of Uttar Pradesh to draw our sample of habitations. Uttar Pradesh is located in the northern part of the country and is the most populous and the fourth largest state of India in terms of land area.<sup>7</sup> At the time of the experiment, the study area was still non-electrified, and households did not know about solar lanterns. This fact offered the required setting to implement our solar lantern interventions.

Solar lanterns are small lamps (about 35 centimeters or 1.15 feet high) powered by a battery that charges when exposed to solar radiation. The solar lanterns we used sold for INR 1,200 in Lucknow, the capital of Uttar Pradesh state.<sup>8</sup> Notably, these lanterns had a USB-port feature, which allowed users to charge a mobile phone. In our sample, households spent on average about INR 42 on lighting needs per month per lamp (typically on kerosene), corresponding to about INR 500 per year. If households purchased the lantern at the market price of INR 1,200, they would amortize it in about two and a half years. We chose the product based on a review of solar lanterns available among Uttar Pradesh distributors. The survey team confirmed that the lanterns performed well regarding lighting quality, duration, and charging power by using them for about a week. This way, we selected the model to be durable, multi-purpose, and convenient to use.

The data collection began with a mapping of 200 primary habitations and 25 replacement habitations around Gonda city. The enumerators approached the habitations in expanding circles, with habitations near Gonda city visited first and those farther away visited later. If a habitation was excluded because of safety concerns or because it had access to grid electricity, a randomly drawn replacement habitation was used instead. Overall, we had to exclude and replace only five habitations. The map of the study area depicting the sample habitations is presented in Figure 1.

Within each habitation, the enumerators approached a randomly chosen seed household.<sup>9</sup> Depending on

---

5. Before implementation, the experiment was approved on the 8th of April 2015 by the internal review board (IRB) of Columbia University (IRB-AAAP2110). We also listed all our research hypotheses and key empirical specifications in a pre-analysis plan (PAP), which we registered at the Evidence in Governance and Politics website.

6. Habitations (also called sub-villages or hamlets) are the lowest administrative units in India. The average size of the habitations in the study area is around 300 people (53 households), which is a bit lower than the state average of 700 people (122 households).

7. See <https://knowindia.gov.in/states-uts/uttar-pradesh.php> for a description of the state.

8. This was equivalent to about USD 18.5 at the time of the fieldwork (Fall, 2015). The solar lantern had a 3-watt solar panel, a 6V 4.5Ah battery, a 3-watt, 24-piece surface-mounted-device LED, and a phone-charging socket. See Fig. 4 of the online appendix for a photo.

9. The enumerators would walk through the habitations and interview the household of the first adult they met.

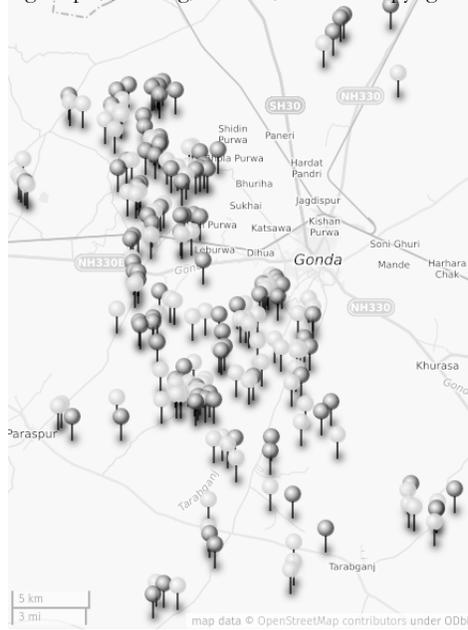

Figure 1: Map of study area around Gonda city. Green dots indicate the habitations with female seeds and blue dots habitations with male seeds.

the treatment, they interviewed either a male or female household member.<sup>10</sup> We gave all seed households a solar lantern and INR 100 (USD 1.54) in exchange for taking part in the survey and inviting one of the three friends for a tea meeting. The seed was requested to provide the names of three friends with whom he or she interacts regularly. The three friends were then randomly assigned to three groups: control, unincentivized, and incentivized communication.<sup>11</sup> The control group was interviewed immediately after the seed household provided names. This procedure ensured that there was no time for information about the lantern to diffuse to the friends in the control group. The unincentivized and incentivized groups were interviewed approximately 30 days after the seed. We surveyed these two groups at the same time to avoid treatment spillovers. Unlike previous studies (e.g., BenYishay and Mobarak 2019; Vasilaky and Leonard 2018), our design holds the seed constant but introduces variation in the seeds' incentive to communicate information about the new technology. This enables us to identify the effects of both unincentivized and incentivized communications on WTP. This feature very likely rules out other mechanisms for information spread. The experiment began with sampling and the control group's interviews in July-August 2015 and

10. We used a random number generator in Excel to generate a random number between 0 and 100 for each habitation. If the number was strictly higher than 50, we assigned the habitation to the female seed treatment.

11. We used a random number generator in Excel to generate a random number for each of the friends' names. We assigned the name with the highest number to the control group, the second to the unincentivized group, and the third to the incentivized group.

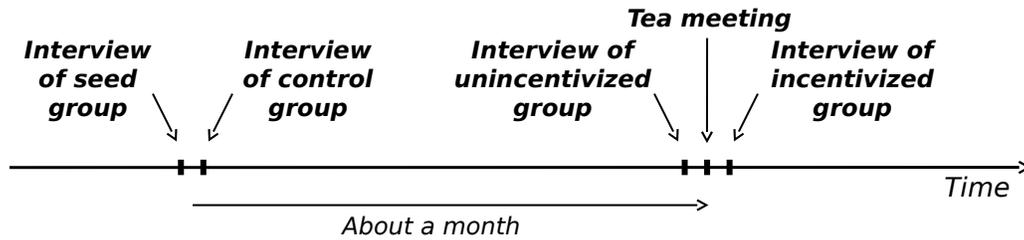

Figure 2: Timeline of the experiment

was completed in October 2015. The timeline of the experiment is summarized in Figure 2.

We waited only 30 days because solar lanterns are products simple enough to learn about in a short time. Thirty days appeared to be reasonably long enough for information about the lantern to flow from the seed to the two treatment groups.<sup>12</sup> If the chosen friend was not the household head, we interviewed the head of the household to which that friend belonged.<sup>13</sup> Households in the three groups were all offered the possibility of buying a solar lantern through a Becker-DeGroot-Marchak (BDM) game, which we present in detail in subsection 3.2. Before playing the BDM game with the households in the incentivized treatment group, we asked the seed to invite his/her “incentivized” friend over for a tea meeting to discuss his/her experience with the lantern. Table 1 summarizes the size of the different treatment groups. We visited a total of 197 habitations, 98 assigned to the male seed treatment, and 99 to the female seed treatment. We dropped three habitations because the unincentivized and incentivized friends had moved out of the village and could no longer be tracked and surveyed. Furthermore, the willingness to pay data is missing for six respondents for unexplained reasons. The final number of observations in the main regressions is, therefore, 585.

The male-female treatment was randomized at the habitation level. One of the co-authors drew a random number for each habitation and assigned the highest 100 numbers to the female treatment. Our survey team attended all tea meetings which the seed households organized for their “incentivized” friend. The enumerators, who all spoke the local dialect, told the seed respondents to share stories about their experience and the performance of the lanterns during the tea meeting. They specifically said that the goal was not to convince their friend to buy a lantern.

12. We document this in the “Mechanisms” section of this paper.

13. The person playing the game needs to be able to make a purchasing decision. That is why we always chose to interview and play the BDM game with the household head.

Table 1: Summary statistics on the size of the treatment groups

	Total number of habitations		
	Control	Unincentivized	Incentivized
Male Seed	98	98	98
Female Seed	99	99	99

*Notes:* In all treatments, we interviewed the household head. We randomized the gender treatment across habitations, and the other treatments within habitations.

### 3.2 Outcome Variable

The outcome variable is the subject’s WTP measured in the BDM game. As Becker et al. (1964) show, the BDM game recovers the subject’s true preference by removing incentives to misrepresent WTP. During the game, the player first announces how much he is willing to pay for the item. Then, a price is drawn from a random distribution. If the drawn price is below the stated WTP, the subject pays the *randomly drawn price*, not the stated WTP.<sup>14</sup> The subject, therefore, has no incentive to understate WTP to obtain a better bargain. This method has been widely applied in development economics to measure WTP because it is incentive-compatible and provides a continuous demand curve, as opposed to demand estimates for a discrete number of price points (as is the case in typical randomized-price WTP elicitation methods) (e.g., Hoffmann 2009; Levine et al. 2012; Guiteras et al. 2013).<sup>15</sup>

The game was played in the field as follows. We asked households to announce their maximum willingness-to-pay on a 0 - 1,200 scale (in INR). Then, the actual price is determined by a random draw from a bag that contains 12 balls, each one of them with a number written on it. The number ranges from INR 0 to INR 1,200 in increments of INR 100.<sup>16</sup> The respondent first makes a bid and then randomly draws a ball. If the price on the ball is higher than the bid, the respondent is not allowed to purchase the lantern. If the price on the ball is lower than the bid, the respondent pays the price on the ball. As a result, when the respondent makes a bid, she/he must make sure to have access to money. The respondent has only one chance to play, and she/he cannot change her/his bid after drawing a ball. Before playing for *real*, we conducted a practice round with a bar of soap to make sure the respondents fully understood the rules.

Figure 3 displays the bids’ distribution: we see that most subjects made a positive bid, but no respondent offered the full market price of the lantern. We also note that WTP displays substantial variation across individuals, spanning 0 to 1200, with mean 239 and standard deviation 266. In the end, a total of 160

14. In fact, it is plausible to argue that the game sets up a real purchasing experience. In that sense, our WTP elicitation is captured through revealed preferences.

15. In practice, prices are drawn from a distribution of discrete numbers, so the demand curve is defined on these numbers only.

16. The game is, therefore, incentive-compatible across increments of INR 100.

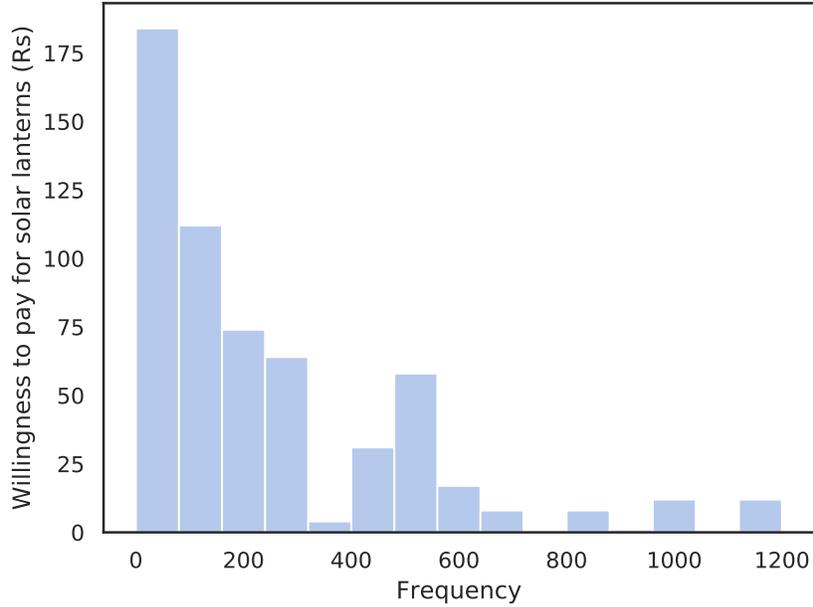

Figure 3: Histogram of bids for solar lanterns. Summary statistics are as follows: minimum = INR 0; maximum = INR 1200; mean = INR 239; standard deviation = INR 266.

respondents ended up purchasing the lantern because their bid was higher than or equal to their draw (42 in the control group, 55 in the unincentivized group, and 63 in the incentivized group).

In implementing the BDM game, we carefully trained enumerators to ensure that they were able to explain the rules clearly and to emphasize the importance of the practice round with soap. Based on our field observations, the respondents seemed to understand the rules quickly. No subject complained afterward or refused to pay when they won the solar lantern. Some respondents were disappointed not to win the lantern, but in that case, they also did not have to pay any money.

### 3.3 Covariate Balance and Power Analysis

We present summary statistics of key baseline variables and statistical tests of balance for covariates in Table 2. We note that the treatment groups are balanced across most covariates, with a few exceptions: gender of the respondent, savings, and indebtedness<sup>17</sup>. The control group has significantly more female-headed households, and about INR 450 fewer savings than other groups. This is a potential source for concern, given households with more savings would be in a better position to bid higher prices. In Section 4, we perform different robustness checks and control for these covariates in additional regressions to re-estimate

<sup>17</sup>. The groups are also not balanced with respect to the timing of the interview by design. We discuss this issue further in Section 5.

 the treatment effects.

In Table 3, we present the statistical test of covariate balance across treatments and the gender of the seed. As expected, households referred by female seeds are more likely to be headed by a female, while households referred by male seeds are usually headed by a male. It follows that the groups display significant differences in variables such as education, consumption expenses, and literacy.

Standard power analysis shows that the experiment can identify plausible treatment effects. Using the control group’s mean and standard deviation (134 and 181 respectively), a standard deviation’s uniform increase (to 315, with a standard deviation of 362) would be detected with a probability of  $\alpha = 0.95$  if the control and treatment group each had at least 65 participants. In our setting, each group has 200 subjects, which exceeds the minimum number of habitations required by a large margin and enables us to detect realistic treatment effects.

## 4 Results

### 4.1 Empirical Strategy

Given randomization, we can identify the impact of our “unincentivized” and “incentivized” communication treatments on WTP for solar lanterns by the mean difference between treatment and control groups in a regression. We specify the regression equation as follows:

$$WTP_{ij} = \alpha + \beta_1 U_i + \beta_2 U_i F_i + \gamma_1 I_i + \gamma_2 I_i F_i + \mu_j + \epsilon_{ij}, \quad (1)$$

where  $WTP_{ij}$  is the willingness to pay by household  $i$  in habitation  $j$  for a solar lantern (our key outcome variable of interest);  $U_i$  is a dummy variable coding for whether household  $i$  is in the unincentivized group;  $F_i$  is a dummy variable coding for whether the lantern was offered to a female (i.e., it equals one if household  $i$  is a friend of a female seed);  $I_i$  is a dummy variable coding for whether the household is in the incentivized group (i.e., household  $i$  attended a tea meeting with the seed);  $\mu_j$  is a vector of habitation fixed effects ( $N = 200$ );  $\epsilon_{ij}$  is an idiosyncratic random error term with the standard distributional assumptions. A term for  $F_i$  does not appear in the equation because, by design, habitation fixed effects account for it. Our objective is to estimate  $\beta_1, \beta_2, \gamma_1$ , and  $\gamma_2$ . Throughout, we cluster standard errors at the habitation level. In this empirical framework, Hypothesis 1 is equivalent to  $\beta_1 > 0$  and  $\beta_1 + \beta_2 > 0$ . On the other hand, Hypothesis 2 corresponds to  $\gamma_1 > 0$  and  $\gamma_1 + \gamma_2 > 0$  and Hypothesis 3 to  $\beta_2 < 0$  and  $\gamma_2 < 0$ .

Notes: Columns 1-3 of this table report summary statistics of baseline variables for the control and treatment groups. Columns 4-6 report statistical (t-test) results on mean differences between the control and the two treatment groups. Standard errors are reported in parentheses. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels, respectively. We also performed a rank-sum (Wilcoxon-Mann-Whitney) test for the variables that do not approximate a normal distribution. Rank-sum tests and t-tests differed only for the variable “Hours of lighting”; the mean difference between the unincentivized and incentivized groups is significant at the 10% level. Column 7 shows the F-statistic for a test of the joint equality of the means across the three groups using a one-way analysis-of-variance (ANOVA). We also ran a non-parametric test of joint equality of the means across the three groups (Kruskal-Wallis). Results differed only for the variables “Hours of lighting” and “Monthly spending per lamp”: the means across the three groups are significantly different for at least two groups at the 10% and 1% level, respectively.

Table 3: Baseline summary statistics and test of balance for variables across treatments and seed gender

Notes: “Male” and “Female” columns report summary statistics of baseline variables by gender of the seed. “Male vs Female” columns report statistical (t-test) results on mean differences between Male and Female groups. Standard errors are reported in parentheses. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels, respectively. We also performed a rank-sum (Wilcoxon-Mann-Whitney) test for the variables that do not approximate normal distribution. The only differences with the t-tests are as follows: 1) The difference in household expenses is not significant in the unincentivized group, 2) The difference in household expenses is not significant in the unincentivized group, 3) The difference in savings is significant at the 10% level in the incentivized group, 4) The difference in irrigated land is not significant in the incentivized group, 5) The difference in the number of kerosene lamps is not significant in the incentivized group.

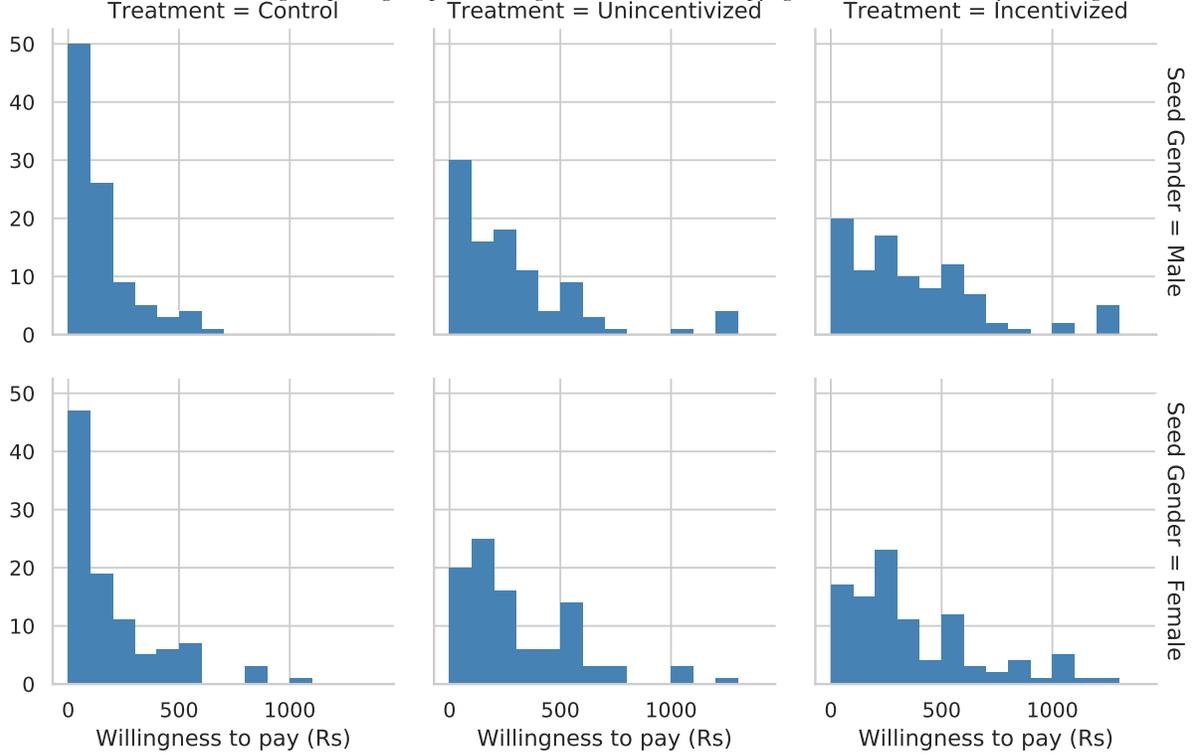

Figure 4: Faceted histogram of bids for solar lanterns across treatment groups

## 4.2 Treatment Effects

We begin by reporting the distribution of bids across treatment groups in Figure 4. We note that there are noticeable differences across groups. In particular, the treatment groups’ distributions display fatter right tails. This likely indicates that our treatments have a positive effect on WTP. On the other hand, we hardly notice any differences when comparing the distribution across male and female seeds, which suggests that our gender treatment may have had no impact.

Mean comparisons do not control for unobserved heterogeneity across habitations or correlation between observations within the same habitation. We, therefore, proceed to using regressions with fixed effects. The main results are shown in Table 4. In all regressions, the standard errors are clustered at the habitation level. In the second column, we do not include the “Female Seed” variable without interaction because it was randomized across habitations, and the regression contains habitation fixed effects. Results show that the unincentivized treatment increased WTP by almost INR 120 compared to the control group. Given that the mean WTP in the control group was INR 134,<sup>18</sup> this corresponds to a 90% increase. Compared

<sup>18</sup> Similarly, the value of the intercept in model 1 of Table 4 is INR 134.5.

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. To the control group, the incentivized treatment increased WTP by INR 195, which corresponds to a 145%

increase. The coefficients for both the communication treatments are also statistically significant at the 1% level. The finding from the incentivized communication treatment is consistent with BenYishay and Mobarak (2019), who showed that providing incentives to communicate with other farmers regarding a new agricultural technology promoted adoption. Our design further enables us to compare the magnitude of unincentivized and incentivized communication in terms of WTP for the new technology.

On the other hand, as shown in column 2 of Table 4, the gender treatment is not statistically significant. The point estimates are negative and correspond to minus INR 34 for the unincentivized group and minus INR 58 for the incentivized group. Some of the friends chosen by the female seeds were, in fact, female household heads. If women identify other women as belonging to the same social identity, then possibly the gender effect that we hypothesized is stronger within the subsample of male household heads. In other words, we expect that the communicator’s female identity leads to more discounting of the information by males than by females. In column 3 of Table 4, we run a regression specification similar to column 2 but excluding households headed by women. Although the point estimate is indeed negative, the effect is not statistically significant. We, therefore, exclude the possibility of not observing a gender impact due to a composition effect. Instead, our results indicate that the mechanism we hypothesized and discussed earlier might not be in place.

Finally, we investigate whether there is an “homophily” effect at play, i.e., whether WTP increases more for seeds and friends with the same gender. We created a variable labeled “Same Gender” that equals one if the seed and the household head playing the BDM share the same gender. In column 4 of Table 4, we interact the variable with our two treatments. The coefficient on the interaction with the unincentivized treatment is small in magnitude and statistically insignificant. The coefficient for the interaction with the incentivized treatment is larger, yet statistically insignificant. Hence, our results do not provide evidence for “homophily”.

### 4.3 Robustness Checks

We perform several robustness checks to probe our results further. First, we control for monthly savings (one of the imbalanced covariates) and estimate the treatment effects. Column 1 of Table 5 shows that the coefficients slightly decrease from INR 120 to 108 for the unincentivized group and from INR 195 to 184 for the incentivized group. Yet, they remain statistically significant at the 1% level. The coefficient for monthly savings is significant at the 5% level, but the magnitude is small: every additional Indian Rupee in savings

Table 4: The impact of unincentivized and incentivized communication on WTP

	(1)	(2)	(3)	(4)

Control group mean	133.50	133.50	133.50	133.50

*Notes:* This table shows the main regression results for the impact of both the unincentivized and incentivized communication treatments on WTP for solar lanterns. Column 1 shows the main treatment effects without interactions. Column 2 shows the treatment effects with an interaction term for the gender of the seed. Column 3 reports similar treatment effects as column 2, excluding the sample of households headed by women. Column 4 presents the treatment effects with an interaction term for whether the seed and the household head playing the BDM game share the same gender. Standard errors clustered at the habitation level are in parentheses. P-values are in square brackets. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels, respectively.

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. <sup>19</sup> correlates with a WTP increase of INR 0.026. Given the imbalance of savings across treatment groups,

this represents an average contribution to WTP of about INR 6 in the control group and about INR 17 to INR 18 in the unincentivized and incentivized groups, respectively. The contribution of savings to the WTP is, therefore, an order of magnitude lower than the contribution of our information treatments. In fact, those with the highest amount of savings are not those who revealed the highest WTP: the raw correlation coefficient between WTP and savings is only 0.15.<sup>20</sup>

In column 2, we interact monthly savings with the treatment dummies. The coefficient for the interaction term with the incentivized treatment is, in fact, significant at the 10% level, indicating that savings and WTP correlate in this treatment group. But the coefficient is negative, indicating that, overall, more savings is not associated with higher WTP. We also run a regression using monthly savings in logs instead of levels in column 3 and find similar results. Specifically, we note that the estimated treatment effect decreases slightly, from INR 120 to 103 in the unincentivized group and from INR 195 to 177 in the incentivized group. But, overall, the effects remain large and significant at the 1% level. Finally, column 5 reports the treatment effects for the sub-sample of respondents who declared having zero savings, which constitute more than half of our observations. We see that the treatment effects in this subsample are very similar to those found for the whole sample. Taken together, these robustness checks confirm that monthly savings are unlikely to drive our treatment effects.

Second, we ran the regressions by controlling for the date when the BDM experiment was conducted and other baseline control variables and report the results in Table 6. Column 2 reports the treatment effects controlling for the date of interview. The variable is correlated with our treatments, because WTP was elicited from the control group earlier than the two treatments by design. Consequently, the treatment coefficients and the standard errors for this specification are much larger. Nevertheless, the exercise remains useful to investigate the robustness of our treatment effects to a possible “income effect.” Indeed, harvesting of maize and rice in the study area started at the end of September and early October, respectively, and about 20% of our treated households were interviewed after September 25. Hence, harvesting partly coincided with our survey of the unincentivized and incentivized groups.<sup>21</sup> If those sampled households began selling their

---

19. On average, the unincentivized (incentivized) group has INR 459 more (INR 438 more) in savings than the control group.

20. The correlation between WTP and the amount of savings can also be seen on a scatterplot in Online Appendix Figure A2.

21. The Rice Knowledge Management Portal, maintained by the Indian Council of Agricultural Research (<http://www.rkmp.co.in/content/rice> growing seasons of uttar pradesh), indicates that, in Uttar Pradesh, summer rice is harvested in April to May and Kharif rice in November to December. On the other hand, wheat is harvested around March to April in the eastern part of Uttar Pradesh and around mid-April in the western part (see <http://www.archive.india.gov.in/citizen/agriculture/index.php?id=11>). Our local team indicated that a reasonable estimate for the first day of harvest in the region around Gonda city was September 25 for maize and October 5 for rice. We use these more conservative dates for our robustness checks.

*Notes:* This table shows the regression results controlling for savings. Columns 1 and 3 show the main treatment effects controlling for savings and the log of savings, respectively. Columns 2 and 4 show the treatment effects with an interaction term for savings and the log of savings, respectively. Column 5 reports the treatment effects for the sample of households who reported zero savings. Standard errors clustered at the habitation level are in parentheses. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels, respectively.

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. harvest, they would likely have been able to afford greater expenditures, and consequently, reveal higher

WTP for the solar lanterns. The variable “Interview date” is the month and day of the month in which we interviewed the respondent. If there is an income effect from harvest sales, the coefficient for “Interview date” should be positive. Column 2 shows that the coefficient is not significant and leans toward negative values.<sup>22</sup> This indicates that respondents interviewed last were no more likely to bid higher amounts and provides supporting evidence against an income effect from the harvest season.

Whether the household head was female or male was another unbalanced variable. We control for it in column 3 of Table 6. Treatment effects for both the unincentivized and incentivized groups change little. In column 4, we control both for whether the household head is female and for the amount of monthly savings. The main treatment effects are slightly reduced but remain large and significant at the 1% level.

In columns 5 and 6, our main results remain robust to the inclusion of several additional control variables. Most variables, such as the level of education, expenditures, whether or not the respondent is in debt, household size, and the number of kerosene lamps display coefficients that are small and statistically insignificant.<sup>23</sup> As a further robustness check, we also implement a least absolute shrinkage and selection operator (LASSO) algorithm to select the variables in column 5 with the most predictive power. None of the variables are selected, but we report the full LASSO results in Online Appendix Table A.12.<sup>24</sup>

#### 4.4 Mechanisms

In this section, we investigate the mechanisms that possibly drive our treatment effects. To do so, we collected detailed data on variables related to knowledge about and the use of solar lanterns, gender norms, and women’s status in the area. Table 7 displays regression results on the impact of our treatments on some of these variables. Columns 1 and 2 indicate that treated respondents are much more likely to have seen a solar lantern before, compared to control respondents. They are also much more likely to know someone who owns a lantern. This is fully consistent with our experimental design and provides evidence that our treatments were implemented properly.

Columns 3 and 4 provide some insights as to why WTP has increased in the two treatment groups. Contrary to the control group, most respondents in the unincentivized and incentivized groups believe that maintenance is important for a solar lantern to function properly. They also estimate the cost of a solar

---

22. Standard errors and coefficients are very large in this case due to the collinearity between our treatment dummies and the “Interview date” variable.

23. We also estimated the treatment effects after dropping the households who reported that someone in their household already owned a solar lantern (8 in total). Our results remained unchanged. See Online Appendix, Table A9 for regression results and Section 5 for the discussion related to households who owned solar lanterns before the treatments were implemented.

24. Our survey team also checked for other possible campaigns promoting solar lanterns in all the sampled habitations, which are likely to be correlated with our treatments. There were none.

Table 6: The impact of unincentivized and incentivized communications on WTP controlling for more covariates

	(1)	(2)	(3)	(4)	(5)	(6)
Unincentivized	115.14*** (22.21)	368.85* (191.16)	110.00*** (22.52)	98.20*** (23.11)	104.07*** (23.26)	405.72** (191.16)

Habitation fixed effects	Yes	Yes	Yes	Yes	Yes	Yes
R-squared	0.16	0.16	0.16	0.17	0.18	0.19
Observations	573	573	573	573	573	573
Control group mean	133.50	133.50	133.50	133.50	133.50	133.50

*Notes:* This table shows the main regression results for the impact of both the unincentivized and incentivized communication treatments on WTP for solar lanterns controlling for savings, the date of the interview, and other covariates. Column 1 shows the main treatment effects. Column 2 shows the treatment effects controlling for the date of the interview. Column 3 shows the treatment effects controlling for the gender of the household head. Control 4 controls both for the gender of the household head and savings. Column 5 shows treatment effects controlling for seven additional baseline variables. Column 6 reports similar treatment effects as column 5 and controlling for the date of the interview. There are fewer observations (573) than in the regressions for the main results reported in Table 4 (585) due to missing values for some of the baseline variables. Standard errors clustered at the habitation level are in parentheses. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels, respectively.

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. lantern at a higher level than the control group. At first, this might seem counter-intuitive. But, perception

of higher costs and maintenance are both consistent with a higher appreciation of the product’s technical properties. It supports the hypothesis that, through interactions with peers, respondents discover how sophisticated the product really is. In the beginning, villagers might expect that solar lanterns are nothing more than basic lamps, like kerosene lamps. They then observe their friend taking care of it. They take notice of the photo-voltaic panel connected to the lamp, allowing the battery to be charged. They also discover the phone-charging feature of the solar lantern. As a result, they perceive the product as a sophisticated item that requires careful maintenance and they become willing to pay a higher price for it.

Finally, columns 5 - 7 report regression results on the impact of the treatments on additional key variables constructed from survey questions for which the responses are coded from “definitely not” (1) to “definitely” (5). We note that almost all respondents thought solar lanterns were definitely innovative products, definitely superior to kerosene lamps, and that they would “definitely” recommend it to others over kerosene lamps. Here, there are no noticeable differences across treatments, as the responses to the survey questions are already concentrated at the highest level (“definitely”).

To investigate the possible mechanisms further, we follow Acharya, Blackwell, and Sen (2016) and estimate the Average Control Direct Effect (ACDE). In the context of experiments, the Control Direct Effect (CDE) is the causal effect of an intervention (or treatment) when the mediator is kept constant at a particular level.<sup>25</sup> In our setup, we investigate the following variables as possible mediators: whether the respondent has seen a solar lantern before; whether the respondent knows someone with a solar lantern; whether the respondent believes maintenance is important; the amount of Rupees spent on kerosene every month; and the number of hours of lighting used every day.

Unfortunately, there is little variation in these variables due to the response scales used in the survey questions. Nevertheless, the regression results presented in Table 8 reveal interesting insights. Column 1 reports the average total effect (ATE), which is equivalent to our main regression results. Columns 2 to 6 present the Average Control Direct Effects estimated using the sequential g-estimation described in Acharya et al. (2016). Each of the ACDE columns in the table shows the ACDE of the two treatment legs for a different mediator variable. We note that the ACDEs are similar to the average total effect. The mediator variable that seems to contribute the most is whether the respondent “knows someone with a solar lantern” (column 3). In this case, the treatment effect decreased from 120 to 95 for the unincentivized group. For the incentivized group, the treatment effect decreased from 195 to 169 (13%).

---

25. We thank an anonymous reviewer for guiding us on how to estimate the Average Control Direct Effect.

Table 7: Effect of treatments on variables highlighting possible mechanisms

Observations	591	591	591	591	590	590	591

*Notes:* This table presents regression results on the effect of the treatments on the variables listed in the top of each column. The dependent variables in columns 1 - 4 are binary. The dependent variables in columns 5 - 7 are ordered (coded from 1 to 5 in the following way: Definitely not, Not really, Neutral, Somewhat, Definitely). The exact phrasing of the questions are shown in Online Appendix Table A.3. Standard errors clustered at the habitation level are in parentheses. \*\*\*, \*\*, and \* denote significance at the 1, 5, and 10% levels.

Although our paper focuses on the impact experienced by only close members of the social network, our findings speak to the basic Bayesian theory of social learning. First, peers likely form their beliefs about the functioning of the solar lantern technology and how to operate it through the information they acquire via their regular interactions with the seed. Then, they update their beliefs about the technology after the seed’s detailed presentation of the technology at the tea meeting, which in turn likely increased their willingness to pay for the lantern.

Finally, we attempt to explain why female seeds seem to act as equally effective communicators in our setting, contrary to our hypothesis. Our survey included a series of questions about gender norms in the sample villages. We report indicators of women’s status in Table 9. The first set of questions reveal gender attitudes consistent with women holding lower social status. For example, we asked respondents whether they believed a woman should ask permission from her husband or a family member before going out. Almost all household heads said that women should ask for permission to go to the health center, visit a friend or go to the market.

On the other hand, answers to other questions reflect more egalitarian views. Only about 5% of the

sample said that they never talked with their spouse about what to spend income on, and about two-thirds said they often had such discussions. In addition, virtually all households thought that women should have a say in how income is spent. Most respondents thought that it was *definitely* important that girls go to school. They further expressed the view that beating a woman was rarely justified. Finally, most respondents thought that women were as able as men to use new technologies. Hence, gender norms in our context appear to give women some say in purchasing decisions, as well as when it comes to using new products. Possibly, gender does not matter when it comes to communicating information about lanterns because women are perceived as rightful users of the products, holding legitimate opinions about such household goods. This may help to explain why, overall, our gender treatment has little effect on willingness to pay.

#### 4.5 Implications for Solar Subsidies

Our study helps draw useful implications for policies that aim at promoting the diffusion of new technologies in developing countries. The adoption of technologies by a household typically generates positive externalities for neighbors. Thus, subsidies are often advocated by development economists to foster the process, especially when the adoption rate is lower than the socially optimal rate (Kremer and Miguel 2007; Cohen and Dupas 2010; Miller and Mobarak 2013). We can use the willingness-to-pay data generated from this experiment to predict the adoption rate under various subsidy rates. Such analysis is useful to governments and other stakeholders interested in fostering the adoption of solar lanterns in non-electrified low-income communities.

Figure 5 illustrates that, starting from a baseline slate where no household knows about solar lanterns (i.e., our control group), covering 20% of the population would require a subsidy of about INR 950 per lantern. But once information has started diffusing (for example, through early adopters), a lower subsidy is required: covering 20% of the population would require an INR 700 subsidy (unincentivized treatment). Finally, assuming a scheme that incentivizes communication about the lanterns, the subsidy could decrease to INR 600 per lantern. This is about the same amount as what the Indian government is currently spending per household on kerosene subsidies, albeit per year (Garg et al. 2017).

India currently subsidizes the retail price of kerosene. The unsubsidized retailed price is INR 35 per liter, but eligible households are allowed to purchase 3 liters per month at a subsidized price of INR 19 per liter. Such subsidy is equivalent to INR 576 per year per eligible household, and one may wonder about switching kerosene subsidies to solar lanterns subsidies. According to Jain et al. (2018), entry-level lanterns typically provide 6 hours of lighting and substitute for two liters of kerosene per month. Mid and high-end lanterns, such as those used in this experiment, provide 9 hours of lighting and substitute for about 3 liters

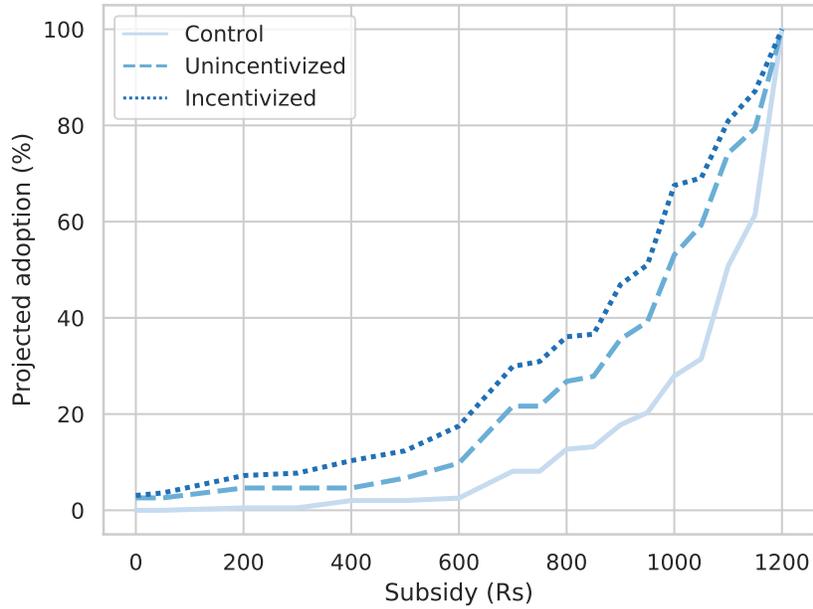

Figure 5: Projected adoption rate of solar lanterns as a function of offered subsidy

of kerosene per month. Households could, therefore, save about INR 684 per year from kerosene spending if they adopted a solar lantern. The full cost of the solar lantern (INR 1200) would be amortized in just under two years. Since the product is fairly robust and a market for repairs is emerging, the lantern could continue to serve for several years, making the cost-benefit analysis all the more in favor of solar lanterns. Beyond the potential for monetary savings in kerosene spending, solar lanterns also offer attractive health benefits compared to kerosene lamps (no risk of burns, fires or poisoning, and lower indoor air pollution).

Last but not least, by adopting solar lanterns, households would save the government INR 576 worth of kerosene subsidy per year. In fact, the government may consider a scheme where households eligible for kerosene subsidies would instead be offered an equivalent subsidy to purchase a solar lantern. This will undoubtedly provide triple dividends by improving the welfare of poor households, while reducing the pressure on public resources and promoting sustainability.

## 5 Discussion

We designed a field experiment to spell out the impact of unincentivized and incentivized communication by peer households on willingness-to-pay for a solar lantern - a new household technology. We asked seeds to provide the names of three friends with whom they regularly interact, and we randomly assigned the friends to a control group, an unincentivized communication treatment and an incentivized communication treatment. It is reasonable to assume that the three friends also knew each other, either as friends or neighbors. In particular, some of the control friends would have won a lantern during our BDM game, and they may have talked about it with the other treated respondents. Consistent with the “complex contagions” social network model by Centola and Macy (2007), information about the solar lanterns could have likely flowed from the control group to the two treatment groups during the 30 day treatment period.

Our treatment effects therefore likely capture both a network amplification effect and the more direct effect of information flowing from seeds to treated households. The magnitude of the network amplification effect, however, is likely small. We find that our results change little when we excluded those habitations where the control respondents won a solar lantern (see column 3 in Online Appendix Table A9). In other words, treated respondents did not systematically reveal a higher WTP when they had two lantern owners in their habitation (the seed and the control). Although this analysis relies on correlation rather than causal inference, it indicates that increased ownership of solar lanterns in one’s social network did not amplify the WTP effect. Unfortunately, one cannot determine to what extent network amplification played a role without using more treatment arms and detailed network data, which we could not implement due to the significant resource implications.<sup>26</sup> Nevertheless, we argue that the treatment effects are driven, to a greater extent, by the direct communication of the treatment groups with the seed. Most importantly, the difference in WTP between the unincentivized and incentivized treatments is due to the quality of the information communicated by the seed. This is indeed one of our key findings.

We elicited WTP for solar lanterns from treatment groups one month after seed households received solar lanterns and one month after eliciting WTP from the control group. Doing so raises the concern of time as a possible confounder. In particular, other solar-related initiatives or the natural diffusion of the solar lanterns may bias our results. However, given the local context, we argue that this is very unlikely.

We asked enumerators to collect information regarding any other solar-related initiatives in the study

---

26. We asked respondents how many friends they had in the village. The mean response was 8 friends (with a standard deviation of 9) for seeds and 6 friends (with a standard deviation of 5) for peers. We also asked people how often they interacted with their friends. Almost all responded that they interacted daily. Therefore, it is reasonable to assume that people are friends with most people living in their habitation.

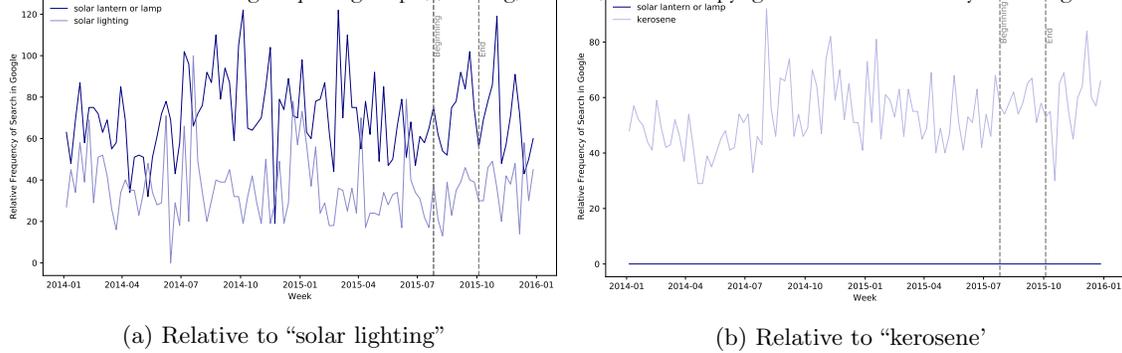

Figure 6: Weekly Frequency of Google Searches in India

*Note:* The frequencies are relative to the highest point on the chart. A value of 100 represents the peak level of popularity for the term. A value of 50 implies that the term is half as popular. A score of 0 indicates there was not enough data for the term.

area during our fieldwork, and it appears that there were none. To provide more concrete evidence, we compiled “Google Trends” statistics from [trends.google.com/trends/](https://trends.google.com/trends/) for India overall. We looked for the frequency with which the terms “solar lantern” or “solar lamp” were searched on Google between 2014 and 2016 and present the results in Figure 6. The figures display the frequency of the terms over time. The signal before and during the experiment looks very similar. The data is noisy due to the low frequencies of the terms. Indeed, when compared to searches made for the term “kerosene”, we see that the signal is effectively reduced to zero. The fact that there are no particular increases in the number of searches for solar lanterns strongly supports our claim that no solar lantern campaigns that could have biased our results took place during the treatment period.

Another potential concern is that solar technologies may be naturally diffusing during our fieldwork. In fact, when interviewing seed and control households in July 2015, we asked whether they had already seen a solar lantern (before our visit). About 25% of seed respondents and 24% of control respondents said “yes”. We further asked where they had seen solar lanterns, and most responded “in town” or at a household in another village. A significant increase in awareness of solar lanterns within the one-month delay of our design would be a potential concern. We argue that this is very unlikely for the following reasons. First, our study focuses on an innovative design that offers superior benefits, not only in durability but also in functionality (USB-port). However, the idea of a lantern running on battery power and charging via solar exposure is not new. Basic designs of solar lamps have been available for sale in urban areas of India for many years before our experiment. Therefore, it is reasonable to assume that respondents’ awareness of solar lanterns was in a steady state.

Second, our data show that the control and treatment respondents did not differ in terms of solar own-

This is the author’s accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press. ership, implying that the one-month delay did not make a difference. Specifically, before eliciting WTP,

we asked respondents whether someone in their household already owned a solar lantern. Only eight peer households answered “yes”: 2 in the control group and 3 in each treatment group. The difference in WTP between these groups is not statistically significant.<sup>27</sup> Finally, the villages in our sample are far from urban centers where diffusion is more likely to occur. Respondents don’t have access to electricity (and therefore do not own a television), and only about 12% of them own a radio. Consequently, it is relatively difficult for them to keep track of what is going on in cities. These facts suggest that, during the one-month treatment period, other solar-related initiatives, or the natural diffusion of the solar lanterns are unlikely to play any significant role.

We acknowledge that other experimental designs could have helped to better establish that time was not a confounder. We attempt to discuss the pros and cons of these alternative designs. One option could have been to create a control group by conducting the BDM game at the same time as the treatment group with another friend of the seed from the village with whom the seed doesn’t communicate for a month. Although this is an attractive option, it would be practically challenging because it is difficult to enforce non-communication between the friend and the seed for a month. Another issue here is that it is likely that the treatment would contaminate the control group even in the absence of communication with the seed, merely through interactions with other villagers who know the seed. Villages are relatively small, and as a result, the whole habitation (and possibly the whole village) should be considered as treated once the lantern is seeded with one inhabitant.

A second alternative would have been to construct a control group by eliciting WTP from a random non-friend respondent in the village at the same time as our treatment groups. Here again, contamination would likely happen and invalidate the use of respondents from the same village as control units. Finally, a third alternative would have been to construct a control group by eliciting WTP from respondents in other random villages at the same time as our treatment groups. In addition to significantly increasing the field budget, this design would have caused other identification challenges, in particular, ensuring that villages are comparable enough to conduct a meaningful analysis. Treatment effects would have to be calculated as differences across villages, which could be problematic, especially with small sample sizes, as the differences in WTP could then be driven by observable or unobservable factors. The design we finally settled on attempted to avoid this problem, albeit at the cost of introducing a one month delay.<sup>28</sup>

---

27. We also estimated the treatment effects after dropping the households who reported that someone in their household already owned a solar lantern (eight in total). Our results remained unchanged (see Online Appendix Table A.9).

28. We thank an anonymous reviewer for encouraging us to discuss these alternative designs.

A key feature of our experimental design involves compensating seed households for taking part in the

study and for inviting one of their friends for tea to share their solar lantern experience. To minimize the likelihood that seeds felt unfairly privileged from receiving a solar lantern plus INR 100, we phrased the experiment to them as a lottery. We informed them that they won a lottery, which awarded a solar lantern and INR 100 in exchange for answering survey questions and arranging another meeting with the survey team in the presence of one of their three best friends. We told them that their friends would also participate in a lottery but without more information about the nature of the lottery. Hence, the seeds did not know *ex-ante* that they would be getting INR 100 more than their friends, and the friends did not know that either. The seeds also did not know that their friends would play a BDM game. In this context, seed households likely felt no more lucky and privileged than their friends for participating in a lottery. This setting helps us rule out the possibility that seeds might have shared some of the INR 100 they received with their “incentivized” friend and that this contributed to the group’s higher WTP.

Other elements in our context also contribute to making sharing the INR 100 unlikely. First, the amount is small compared to the seeds’ overall savings (about INR 1700) and monthly spending (about INR 4700). The INR 100 represents only 6% and 2% of savings and monthly spending respectively. The payment is, therefore, unlikely to have drawn much attention from the friends. Second, assuming seed households did share the payment with their friends, a plausible assumption is that those with higher savings transferred more money. We checked for this possibility by estimating the treatment effects while controlling for the seeds’ savings and an interaction term between the treatments and savings. The results show that this is not the case: the seed’s amount of savings does not correlate with our treatment effects (see Online Appendix Table A10).

## 6 Conclusions

The adoption of new technologies is crucial to improve the livelihood of poor communities, and information sharing through social networks can accelerate it. Technology adoption is inherently a social process because one individual’s adoption creates positive information externalities that spill over to peers and increase their expected welfare (Bardhan and Udry 1999). Does rewarding individuals who make a conscious effort to communicate information about new technologies raise WTP by members of a social network? What are the mechanisms that explain the increase in WTP? Which member of the household matters for information about new technologies to flow more effectively through social networks? In this paper, we attempted to answer these questions by crafting a randomized controlled trial where we distributed solar lanterns under

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

unincentivized and incentivized communication treatments to households in 200 non-electrified villages in

rural India. Compared to previous studies, the design enables us to identify the magnitudes of the unincentivized and incentivized communication and propose subsidy options that offer triple dividends - improving the welfare of poor households, reducing the pressure on public resources, and promoting sustainability.

We find that learning about the technology via peers can significantly increase WTP. The unincentivized communications treatment group is willing to pay INR 120 more than the control group. This effect implies that having peers using solar lanterns in one's social network makes one willing to pay more for them. Typically, diffusion of new technology begins with a few early adopters trying out the product. These first adopters generate knowledge externalities, "learning-by-using," which the next generation of adopters can use to update their beliefs regarding the costs and benefits of the technology. Therefore, the unincentivized treatment effect may be understood as capturing the magnitude of the knowledge spillovers from one wave of adopters to the next. Even though the absolute magnitude is relatively small, it represents a WTP of almost double the initial WTP (about a 90% increase).

The incentivized communication treatment, on the other hand, investigates the impact of increasing the intensity of information exchanges about solar lanterns. The key idea here is to leverage some actors to take a more active role in the diffusion of information within their social network. We find that attending a demonstration session led by a peer who experienced the technology increases WTP by INR 195, a 145% increase compared to the control group, and a further 55 percentage point increase compared to the unincentivized treatment group. We also investigated whether potential adopters respond to information more intensively when communicators are male rather than female. We found that the gender of the communicator did not matter. Finally, we showed that the treatment effects on WTP revealed by our interventions provide helpful insights into how to use scarce public resources to promote adoption and diffusion of new household technologies in general and solar technologies in particular. Future research might be able to use richer designs which deal with the role of time as a confounder, test the robustness of our findings, and shed more light on these issues.

## 1 Additional Tables and Figures

Below is the list of additional tables and figures.

- Table A1 reports a longer version of Table 2 in the main manuscript.
- Table A2 provides a longer version of Table 3 in the main manuscript.
- Table A3 provides a description of the variables used in Table 7 of the main manuscript.
- Table A4 presents summary statistics for the two seed samples (male and female), with the corresponding z statistics of the rank-sum test. Only variables with statistically significant differences are reported.
- Table A5 displays characteristics of the friends chosen by the male seeds and the female seeds, with the corresponding z-statistics of the rank-sum test. Only variables with statistically significant differences are reported.
- Table A6 provides a detailed description of the variables used in Table A4 and Table A5.
- Table A7 displays summary statistics for based on the gender of the respondent.
- Table A8 presents summary statistics of WTP and mean comparison tests across the different treatment groups.
- Table A9 presents treatment effects on WTP dropping habitations with solar lantern owners.
- Table A10 presents treatment effects on WTP and seed savings
- Table A11 presents summary statistics for some key solar lantern related variables highlighting possible mechanisms.
- Table A12 presents treatment effects controlling for more covariates through the LASSO algorithm.
- Figure A1 shows a box-plot of the amount of savings in rupees in the treatment groups.
- Figure A2 shows a hexabin plot of WTP and the amount of savings in rupees.

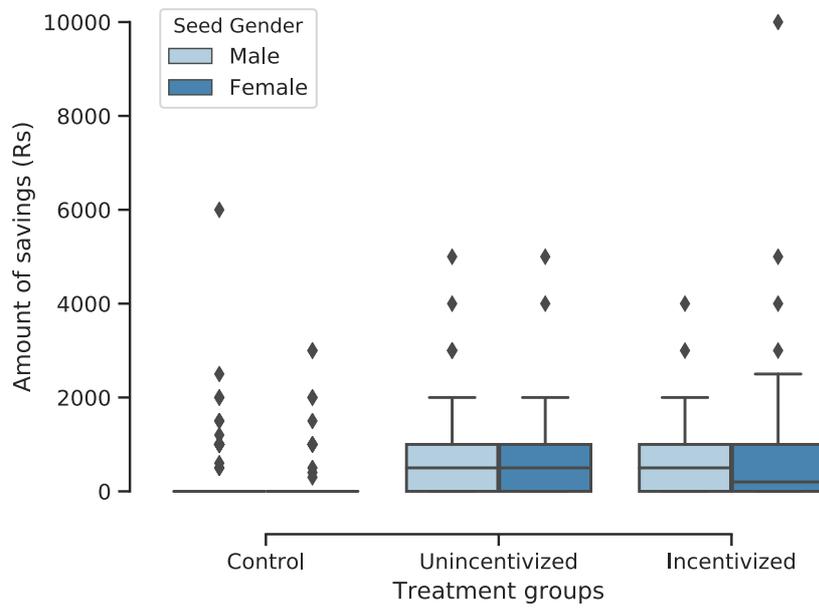

Figure A1: Box-plots of the amount of savings in rupees per treatment group

Table A1: Baseline summary statistics and test of balance for covariates

Variable	(1) Control	(2) Unincentivized	(3) Incentivized	(4) Control vs Unincent.	(5) Control vs Incent.	(6) Unincent. vs Incent.	(7) Joint

*Notes:* Columns 1-3 present summary statistics of a series of variables for the different treatment groups. Columns 4-6 present t-test results on mean differences between treatment groups. Standard errors of the differences in means are reported in parentheses. \*\*\*, \*\* and \* denote significance at the 1, 5 and 10% levels, respectively. We also performed rank-sum tests (Wilcoxon-Mann-Whitney) for variables not normally distributed. Results differed from the t-tests for the following variable: 1) The difference between control and incentivized for “Number of children to school” is significant at the 10% level, and 2) The difference between unincentivized and incentivized for “Hours of lighting” is now significant at the 10% level. Column 7 contains the F statistic for a test of joint equality of the means across the three treatment groups using a one-way analysis-of-variance (ANOVA). We added stars to show the significance levels that each F statistic corresponds to. We also ran a non-parametric test of joint equality of the means across the three treatments (Kruskal-Wallis). Results differed for the following variables: “Hours of lighting” and “Monthly spending per lamp” whose means across the three groups are significantly different for at least two groups at the 10% and 1% level, respectively.

Table A2: Baseline summary statistics and test of balance for variables across treatments and seed gender

Notes: "Male" and "Female" columns present summary statistics of variables for the different treatment groups. "Male vs Female" columns present statistical t-test results on mean differences between Male and Female groups. Standard errors of the differences in means are reported in parentheses. \*\*\*, \*\* and \* denote significance at the 1, 5 and 10% levels, respectively. We also performed a rank-sum test (Wilcoxon-Mann-Whitney) for the variables that do not approximate a normal distribution. The only differences with the t-tests are as follows: 1) The difference in education level is significant at 10% in the control group, 2) The difference in household expenses is not significant in the unincentivized group, 3) The difference in savings of the seeds is significant at 10% in the incentivized group, 4) The difference in irrigated land is not significant in the incentivized group, 5) The difference in the number of kerosene lamps is not significant in the incentivized group.

<b>Question</b>	<b>Answer type</b>	<b>Label used in table</b>
Have you seen a solar lantern before?	Yes or no.	If has seen a solar lantern before
Do you know someone with a solar lantern?	Yes or no.	Knows someone with a solar lantern
Do you think a solar lantern can function properly without many maintenance problems?	Yes or no.	Believes maintenance is important
How much would you say this solar lantern costs?	Amount in Rupees.	Estimated cost of the solar lantern
Do you think that the solar lantern is an innovative product?	Definitely not, Not really, Neutral, Somewhat, Definitely.	Believes it is innovative
Would you say that a solar lantern is a superior product compared to a kerosene lamp?	Definitely not, Not really, Neutral, Somewhat, Definitely.	Believes it is superior to kerosene lamps
Do you think you will recommend others to use a solar lantern instead of a kerosene lamp?	Definitely not, Not really, Neutral, Somewhat, Definitely.	Would recommend over ker. lamp

<b>Question</b>	<b>Answer type</b>	<b>Label used in table</b>
Do your children use lighting for studying	Yes or No.	Children use lighting for studying
Do you believe your current lighting solution is bad for your eyesight?	Definitely not = 1, Not really = 2, Neutral = 3, Somewhat = 4, Definitely = 5.	Current lighting bad for eyesight
Who in your household do you think will/would mostly be using the solar lantern?	Myself, My spouse, My children, No one, Others	Mostly be using: myself and Mostly be using: my spouse
Do you and your spouse talk about what to spend money on?	Never = 0, Sometimes = 1, Often = 2	Talk about how to spend money
Do you think more women should work outside of the household or own a business?	Definitely not = 1, Not really = 2, Neutral = 3, Somewhat = 4, Definitely = 5	More women should work outside
How often did you participate in village meetings during the past six months?	Almost all of them = 2, Some of them = 1, None of them = 0	Participation in village meetings
How often did you participate in farmers’ cooperative meetings during the past six months?	Almost all of them = 2, Some of them = 1, None of them = 0	Participation in farmers’ cooperative meetings
How often did you participate in religious group events during the past six months?	Almost all of them = 2, Some of them = 1, None of them = 0	Participation in religious group events
How often did you participate in political events during the past six months?	Almost all of them = 2, Some of them = 1, None of them = 0	Participation in political events
Do you trust other villagers?	Definitely not = 1, Not really = 2, Neutral = 3, Somewhat = 4, Definitely = 5	Trust other villagers
In your spare time, do you mostly spend time with your friends or stay home?	Spend time with friends = 1, Stay home = 0	Spend time with friends (dummy)
How many friends do you have in this village?	number of friends	Number of friends

Table A8: Means and t-tests across treatments.

*Notes:* The first 3 rows of Columns 1-3 present summary statistics of WTP for the different treatment groups. Columns 4-6 and Row 4 contain t-test results on mean differences between treatment groups. Standard errors of the differences in means are reported in parentheses. \*\*\*, \*\* and \* denote significance at the 1, 5 and 10% levels, respectively. We also performed rank-sum tests (Wilcoxon-Mann-Whitney) for variables not normally distributed. Results did not differ. Chi-square tests for whether the mean WTP is the same in all treatment groups always yield that the three coefficients are different at the 1% level in the whole sample as well as in the subsample of female seeds and the subsample of male seeds.

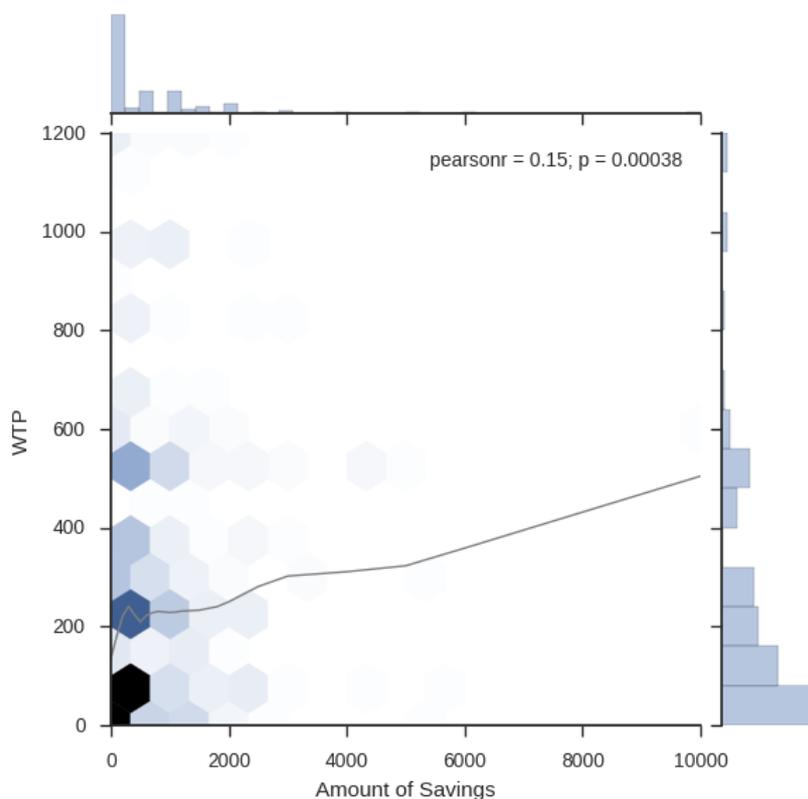

Figure A2: Hexabin plot of WTP and amount of savings in Rupees.

Table A9: Treatment effects on WTP dropping habitations with solar lantern owners

	(1) All	(2) No Lantern Before	(3) No Control Purchase	(4) Both
Unincentivized	119.88*** (22.11)	121.84*** (22.54)	151.23*** (24.11)	152.00*** (24.42)

Standard errors in parentheses

\*  $p < 0.10$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$

*Notes:* This table reports treatment effects on WTP using a least absolute shrinkage and selection operator (LASSO) algorithm. Column 1 shows the main treatment effects controlling for baseline variables. Column 2 presents LASSO regression results. Column 3 reports the main treatment effects excluding the baseline control variables. \*\*\*, \*\* and \* denote significance at the 1, 5 and 10% levels, respectively.

## 2 Additional Information on the Experimental Design

*Before implementation, the experiment was approved on the 8th of April 2015 by the internal review board (IRB) of Columbia University (IRB-AAAP2110).*

### 2.1 Outline of the Experimental Design

We start the experiment by sampling 200 households (the Seed group). These households are given a free solar lantern and will answer a survey. Each household is requested to name three close friends. In total, we then obtain 600 names: these 600 households constitute the actual sample for our experiment, i.e. the households from whom we will extract the willingness to pay (WTP) for lanterns.

We start the experiment with visiting all 200 seed households. We then randomize at two levels. First, 100 households are randomly chosen and assigned to the Male treatment; the other 100, to the Female treatment. In the Male group, the enumerator must interview the male head of the household and ask him to name three close friends of his. In the Female group, the enumerator must interview the female spouse of the household head, and ask her to name three close friends of hers. All seed households will be given a free lantern and 100 rupees conditional on inviting one of the friends that were named for tea/coffee and giving them an introduction to the solar lantern. Hence, we give the seed households an incentive to communicate about the solar lantern.

Finally, we randomly assign each of the three names provided by the seed to either the Control group, the Unincentivized group or the Incentivized group. Households in the Control group are visited and asked for WTP immediately after the interview with the seed household. Households in the Unincentivized group are visited and asked for WTP approximately one month after the interview with the seed household and before the tea meeting between the seed and the friend. Households in the Incentivized group are invited to the seed house for tea a month later. Right after the tea meeting, households in the Incentivized group are visited and asked for WTP.

The sequence of events is represented in Figure A3, and reads as follows:

- Selection and interview of the Seed group (200 households, where 100 households belong to the Male treatment and 100 households to the Female treatment)

- Immediately after, interview of the Control group (200 households, where 100 households belong to the Male treatment and 100 households to the Female treatment)
- About a month later, interview of the Unincentivized group (200 households, where 100 households belong to the Male treatment and 100 households to the Female treatment)
- Immediately after the interview of the Network group is finished, attend the tea meeting between the seed and the friend assigned to the Incentivized group. (200 meetings)
- After the tea meeting, interview of the Incentivized group (200 households, where 100 households belong to the Male treatment and 100 households to the Female treatment)

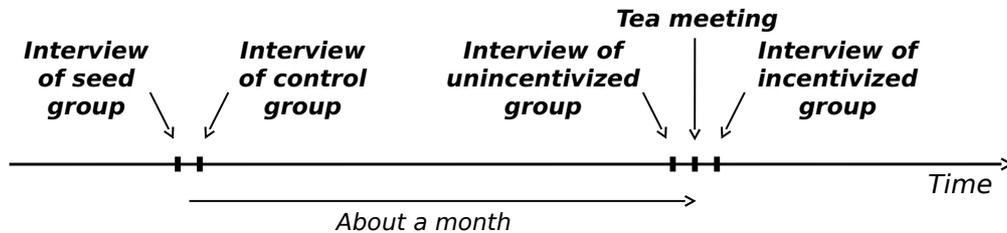

Figure A3: Timeline of the experiment.

Both the seed households and sample households are requested to respond to a short survey questionnaire. The questionnaire was administered in Hindi by experienced enumerators with local knowledge.

## 2.2 Information on the Selection and Eligibility of Participants

To be selected in the Seed group, a household must verify the following conditions:

- the household should be composed of a married couple.
- the household cannot live in the same habitation as another household.
- the household should not have access to electricity.
- the household should not already own a solar lantern or know someone who owns one. Hence, the selected geographic area should have very low penetration of solar lanterns.

### 2.3 Field Work Photographs

### Introduction to Respondent (Household Head if possible)

Good morning! I work with MORSEL, an organization based in Lucknow that conducts surveys in India. [Interviewer shows ID card to the respondent]. Your household has been selected to participate in a short survey. The survey is a Columbia University study, led by Dr. Johannes Urpelainen, and focusing on households with no access to electricity.

साक्षात्कारदाता से परिचय (घर के मुखिया से)

नमस्ते! मैं लखनऊ में स्थित एक कम्पनी मोर्सेल के साथ काम करता हूँ जो कि पूरे भारत में सर्वेक्षण करती है. [साक्षात्कारकर्ता अपना आईडी कार्ड उत्तरदाता को दिखाएँ]. आपका परिवार एक छोटे से सर्वेक्षण में भाग लेने के लिए चुना गया है. यह सर्वेक्षण कोलंबिया विश्वविद्यालय का एक अध्ययन है और डॉ. जोहानस उपरलिन के नेतृत्व में किया जा रहा है. यह उन घरों के लिए है जिनके यहाँ किसी भी तरह की बिजली की व्यवस्था नहीं है.

109) Does your household have any electricity? 1 Yes 0 No (IF "YES", END THE INTERVIEW)

क्या आपके घर में किसी तरह की बिजली है? 1 हाँ 0 नहीं

\*\*\*\*\*

MALE TREATMENT पुरुष ट्रीटमेंट

\*\*\*\*\*

The survey will take no more than 30 minutes, and we would like the household head to answer it.

[IF THE PERSON IS NOT THE HOUSEHOLD HEAD, ASK TO TALK TO THE HOUSEHOLD HEAD].

इस सर्वे में 30 मिनट से ज्यादा नहीं लगेंगे, और हम इस घर के मुखिया से बात करना चाहेंगे

[यदि व्यक्ति घर का मुखिया नहीं है तो मुखिया से बात करने के लिए कहिये]

110m) Are you the household head? 1 Yes 0 No

क्या आप परिवार के मुखिया हैं? 1 हाँ 0 नहीं

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

**111m) Gender** [OBSERVES GENDER OF HOUSEHOLD HEAD] 0 Male 1 Female

(IF FEMALE, END INTERVIEW)

लिंग [परिवार के मुखिया के लिंग को बिना पूछे लिखें] 0 पुरुष 1 महिला (यदि महिला, तो साक्षात्कार समाप्त करें)

**112m) Would you like to participate?** 1 Yes 0 No

(IF NO, END INTERVIEW)

क्या आप हिस्सा लेना पसंद करेंगे? 1 हाँ 0 नहीं (यदि नहीं, तो समाप्त करें)

\*\*\*\*\*

FEMALE TREATMENT महिला ट्रीटमेंट

\*\*\*\*\*

The survey will take no more than 30 minutes, and we would like the spouse of the household head to answer it.

[IF THE PERSON IS NOT THE SPOUSE OF THE HOUSEHOLD HEAD, ASK TO TALK TO THE SPOUSE].

इस सर्वे में 30 मिनट से ज्यादा नहीं लगेंगे, और हम इस घर के मुखिया से बात करना चाहेंगे

[यदि व्यक्ति घर के मुखिया की पत्नी नहीं है तो मुखिया की पत्नी से बात करने को कहिये]

**110f) Are you the spouse of the household head?** 1 Yes 0 No

क्या आप घर के मुखिया की पत्नी हैं? 1 हाँ 0 नहीं

**111f) Gender** [OBSERVES GENDER OF HOUSEHOLD HEAD] 0 Male 1 Female

(IF MALE, END INTERVIEW)

लिंग [परिवार के मुखिया के लिंग को बिना पूछे लिखें] 0 पुरुष 1 महिला (यदि पुरुष, तो साक्षात्कार समाप्त करें)

**112f) Would you like to participate?** 1 Yes 0 No

(IF NO, END INTERVIEW)

क्या आप हिस्सा लेना पसंद करेंगे? 1 हाँ 0 नहीं (यदि नहीं, तो समाप्त करें)

\*\*\*\*\*

ALL TREATMENTS सभी ट्रीटमेंट

\*\*\*\*\*

**113) Name of the respondent** आपका नाम \_\_\_\_\_

**114) Mobile phone for contact** संपर्क के लिए आपका फ़ोन नंबर \_\_\_\_\_

**115) Could you give us the name and contact number of three of your best friends?**

We would like to get in touch with them to ask them what they think about solar lanterns and offer them the opportunity to enter a lottery to get one.

115a) Name 1:

115b) Name 2:

115c) Name 3:

क्या आप हमें अपने सबसे अच्छे तीन सबसे अच्छे दोस्तों के नाम और फ़ोन नंबर बता सकते हैं?

हम उनके संपर्क में रहेंगे ताकि ये जान सकें कि वह सोलर लालटेन के बारे में क्या सोचते हैं और लाटरी में शामिल होकर इसे पा सकें इसकी पेशकश करेंगे

115a) नाम 1:

115b) नाम 2:

115c) नाम 3:

**116) How often do you visit them?**

A. Every day

B. Every week

C. Every month

D. Less than once a month

आप उनसे कब-कब मिलते हैं?

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

- A. रोज  
B. सप्ताह में एक बार  
C. महीने में एक बार  
D. महीने में एक बार से कम

[Assign randomly each name to one of the three treatment: control, network, or communication.]

[Tell the participant that s/he should invite that one friend assigned to the communication group for tea over to his/her house according to what was agreed at the beginning of the interview.]

[उपरोक्त दिए गए नामों को इन तीन समूहों में (कण्ट्रोल, दृरीटमेंट, या कम्युनिकेशन) में randomly बाँटिये.]

[उत्तरदाता को इस बात की जानकारी दे दीजिये कि उनको कम्युनिकेशन समूह में डाले गए दोस्त को एक महीने बाद अपने घर पर चाय के लिए मीटिंग में निर्धारित समय पर आने के लिए न्योता देना है जिसके बारे में सर्वे की शुरुवात में आप सहमत हुए थे]

In exchange for 100 Rupees and a free solar lantern. [SHOW THE SOLAR LANTERN.], would you accept to meet again with us in the presence of one of your best friend over to your household to show him/her the solar lantern in the presence of a person from MORSEL? The meeting must happen in about one month.

यदि आपको 100 रूपए और मुफ्त में एक सोलर लालटेन दी जाये तो क्या आप सबसे अच्छे दोस्तों में से एक के साथ अपने घर पर मोर्सेल के प्रतिनिधि की उपस्थिति में इस सोलर लालटेन को दिखाने के लिए तैयार हैं? यह मीटिंग लगभग एक महीने बाद होगी

117) Do you accept? 1 Yes 0 No

क्या आप इसके लिए सहमत हो? 1 हाँ 0 नहीं

118) What day and time will you invite your friend over?

118a) DAY:

118b) TIME:

आप अपने दोस्त को कब और किस समय आने के लिए न्योता दोगे?

118a) दिन:

118b) समय:

\*\*\*\*\*

## Section 2 Socioeconomic information सामाजिक-आर्थिक जानकारी

\*\*\*\*\*

200) Were you born in this village? 1 Yes 0 No

आप इसी गाँव में पैदा हुए? 1 हाँ 0 नहीं

201) What is the year of your birth? \_\_\_\_\_ (yyyy)

आप किस साल पैदा हुए? \_\_\_\_\_ (साल)

202) How many people live permanently in this household? \_\_\_\_\_ (NUMBER)

इस घर में स्थाई रूप से कितने लोग रहते हैं? \_\_\_\_\_ (संख्या)

203) Your relationship status?

- A. married  
B. divorced  
C. separated  
D. widow, widower  
E. never married

आपकी वैवाहिक स्थिति

- A. शादीशुदा  
B. तलाकशुदा  
C. अलग हो गए  
D. विधुर/विधवा  
E. शादी नहीं हुई

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

204) What is the year of your spouse's birth?

आपके जीवनसाथी का जन्म किस साल हुआ

\_\_\_\_\_ (साल)

205) How many children do you have?

आपके कितने बच्चे हैं?

\_\_\_\_\_ children

\_\_\_\_\_ बच्चे

206) How many of your children go to school?

आपके कितने बच्चे स्कूल जाते हैं?

\_\_\_\_\_ children

\_\_\_\_\_ (बच्चे)

207) How many of your children are male?

आपके कितने लड़के हैं?

\_\_\_\_\_ children

\_\_\_\_\_ (बच्चे)

208) What is your religion?

- A. Hindu
- B. Muslim
- C. Other

आपका धर्म क्या है?

- A. हिन्दू
- B. मुस्लिम
- C. अन्य

209) What is your caste?

- A. Forward Caste
- B. Scheduled Caste
- C. Scheduled Tribe
- D. Other Backward Caste

आपकी जाति क्या है?

- A. सामान्य
- B. अनुसूचित जाति
- C. अनुसूचित जनजाति
- D. अन्य पिछड़ा वर्ग

210) Which level of schooling have you completed?

- A. No formal education
- B. Primary
- C. Secondary
- D. High School
- E. Intermediate
- F. Graduate/Post Graduate

आपकी शिक्षा कहाँ तक हुई है?

- A. कोई औपचारिक शिक्षा नहीं
- B. प्राइमरी
- C. सेकेंडरी
- D. हाई स्कूल
- E. इन्टरमिडियट
- F. स्नातक/परास्नातक

211) Which level of schooling have your spouse completed?

- A. No formal education
- B. Primary
- C. Secondary
- D. High School

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

- E. Intermediate
- F. Graduate/Post Graduate

आपके जीवनसाथी की शिक्षा कहाँ तक हुई है?

- A. कोई औपचारिक शिक्षा नहीं
- B. प्राइमरी
- C. सेकेंडरी
- D. हाई स्कूल
- E. इन्टरमिडियट
- F. स्नातक/परास्नातक

212) Can you read in Hindi?

1. Yes 0 No

क्या आप हिंदी पढ़ सकते हैं?

1. हाँ 0. नहीं

213) What is your occupation?

- A. Businessman
- B. Laborer
- C. Government employee
- D. Agriculture
- E. Other
- F. Not working

आप क्या काम करते हैं?

- A. व्यापारी
- B. मजदूर
- C. सरकारी कर्मचारी
- D. कृषि
- E. अन्य
- F. काम नहीं करते (बेरोजगार)

214) What is your spouse occupation?

- A. Businessman
- B. Laborer
- C. Government employee
- D. Agriculture
- E. Other
- F. Not working

आपके जीवनसाथी क्या काम करते हैं?

- A. व्यापारी
- B. मजदूर
- C. सरकारी कर्मचारी
- D. कृषि
- E. अन्य
- F. काम नहीं करते (बेरोजगार)

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

215) Do you own a business? 1 Yes 0 No

क्या आप कोई व्यापार करते हैं? 1. हाँ 0. नहीं

216) Do you have a government ration card? 1 Yes 0 No

क्या आपके पास सरकारी राशन कार्ड है? 1. हाँ 0. नहीं

217) How many rupees a month does your household spend on average? \_\_\_\_\_ RUPEES

आपका परिवार महीने में औसतन कितने रुपये खर्च करता है? \_\_\_\_\_ रुपये

218) Do you have any savings at the end of the month? 1 Yes 0 No

क्या महीने के अंत में आपके पास कोई बचत होती है? 1. हाँ 0. नहीं

219) If yes, how much? \_\_\_\_\_ RUPEES

यदि हाँ तो कितनी? \_\_\_\_\_ रुपये

220) Is your household currently indebted? 1 Yes 0 No

क्या आपका परिवार इस समय कर्ज में है? 1. हाँ 0. नहीं

\*\*\*\*\*

### Section 3 Assets

\*\*\*\*\*

300) What is the main material of your home floor?

A. Mud B. Wood, bamboo C. Brick  
D. Stone E. Cement F. Mosaic, floor tiles G. Other: \_\_\_\_\_

आपके घर की फर्श मुख्यता किस चीज की बनी है?

A. मिट्टी B. लकड़ी, बांस C. ईंट  
D. पत्थर E. सीमेंट F. मोसैक, फर्श टाइल्स G. अन्य: \_\_\_\_\_

301) What is the main material of your roof?

A. Grass, thatch, bamboo, wood, mud B. Plastic, Polythene C. Tiles D. Slate  
E. Metal, Asbestos sheets F. Brick G. Stone H. Concrete I. Other: \_\_\_\_\_

आपकी छत मुख्यता किस चीज की बनी है?

A. घास, भूसा, बांस, लकड़ी, मिट्टी B. प्लास्टिक, पन्नी C. टाइल्स D. खपरैल  
E. टीन या सीमेंट की चदर F. ईंट G. पत्थर H. कंक्रीट I. अन्य: \_\_\_\_\_

302) What is the main toilet facility for this household?

- A. No toilet
- B. Flush toilet
- C. Pit Latrine
- D. Ventilated Improved Pit Latrine
- E. Other:

इस घर के लिए मुख्यता शौचालय की क्या व्यवस्था है?

- A. कोई शौचालय नहीं
- B. फ्लश शौचालय
- C. गड़ढे वाला शौचालय
- D. उन्नत हवादार गड़ढे वाला शौचालय
- E. अन्य: \_\_\_\_\_

303) What is the household's main source of drinking water?

- A. Piped water inside dwelling
- B. Private outside standpipe/tap
- C. Public standpipe /tap
- D. Neighbouring household

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

#### Section 4 Lighting

\*\*\*\*\*

400) Do you use any artificial lighting? 1 Yes 0 No

क्या आप कोई कृत्रिम रोशनी का इस्तेमाल करते हैं? 1 हाँ 0 नहीं

401) Which of the following do you primarily use for lighting?

- A. Kerosene lamps 1 Yes 0 No  
B. Candles 1 Yes 0 No  
C. Battery charged lamps 1 Yes 0 No  
D. Solar-powered lamps 1 Yes 0 No  
E. Firewood 1 Yes 0 No  
F. Grid electricity 1 Yes 0 No  
G. Other (specify): \_\_\_\_\_

रोशनी के लिए मुख्य रूप से इनमे से आप क्या इस्तेमाल करते हैं?

- A. मिट्टी के तेल का लैंप 1 हाँ 0 नहीं  
B. मोमबत्तियाँ 1 हाँ 0 नहीं  
C. बैटरी से चार्ज होने वाला लैंप 1 हाँ 0 नहीं  
D. सूरज की रोशनी से चार्ज होने वाला लैंप 1 हाँ 0 नहीं  
E. जलौनी लकड़ी 1 हाँ 0 नहीं  
F. सरकारी बिजली 1 हाँ 0 नहीं  
G. अन्य(उल्लेख कीजिये) \_\_\_\_\_

402) How many kerosene lamps do you own? \_\_\_\_\_ lamps

आपके पास कितने मिट्टी के तेल वाले लैंप हैं? \_\_\_\_\_ लैंप

403) What type of kerosene lamps do you have?

- A. Kerosene lamp with no cover 1 Yes 0 No  
B. Kerosene lamp with glass cover 1 Yes 0 No  
C. Pressurized kerosene lamp 1 Yes 0 No

आपके पास किस तरह का मिट्टी के तेल वाला लैंप है?

- A. बिना कवर के मिट्टी के तेल का लैंप 1 हाँ 0 नहीं  
B. शीशे वाले कवर के साथ मिट्टी के तेल का लैंप 1 हाँ 0 नहीं  
C. मिल्टन वाला मिट्टी के तेल का लैंप 1 हाँ 0 नहीं

404) What does your household use lighting for? [CHECK ALL THAT APPLY]

- A. Business  
B. Studying  
C. Cooking, cleaning, laundry  
D. Meeting with friends and family  
E. Other (specify) \_\_\_\_\_

आपका घर किस लिए रोशनी का इस्तेमाल करता है? [जो-जो लागू हो उसे दर्ज करें]

- A. व्यापार  
B. पढ़ाई-लिखाई  
C. खाना-बनाना, सफाई, कपड़ा धुलाई  
D. परिवार और दोस्तों संग बैठकी में  
E. अन्य(उल्लेख करें) \_\_\_\_\_

405) Do your children also use lighting? 1 Yes 0 No

क्या आपके बच्चे भी रोशनी का इस्तेमाल करते हैं? 1 हाँ 0 नहीं

406) If yes, do they use it for studying? 1 Yes 0 No

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

यदि हाँ, तो क्या इसका इस्तेमाल पेढाई के लिए करते हैं? 1 हाँ 0 नहीं

407) On average, how many hours of artificial lighting do you have a day? \_\_\_\_\_ HOURS

एक दिन में औसतन कितने घंटे कृत्रिम रोशनी का इस्तेमाल करते हैं? \_\_\_\_\_ घंटे

408) How many rupees per month do you spend on lighting fuel?

A. Electricity \_\_\_\_\_ RUPEES

B. Kerosene \_\_\_\_\_ RUPEES

C. Battery charged lamps \_\_\_\_\_ RUPEES

रोशनी के लिए ईंधन पर हर महीने आप कितना खर्च करते हैं?

A. बिजली पर \_\_\_\_\_ रूपए

B. मिट्टी के तेल पर \_\_\_\_\_ रूपए

C. बैटरी से चार्ज होने वाले लैंप पर \_\_\_\_\_ रूपए

409) Do you believe your current lighting solution is bad for your eyesight?

A. Definitely not

B. Probably not

C. Maybe

D. Probably

E. Definitely

F. Don't know

क्या आप ऐसा मानते हो कि आपके घर में रोशनी की जो व्यवस्था है वह आपकी आँखों के लिए नुकसान दायक है

A. निश्चित-रूप से नहीं

B. शायद नहीं

C. हो सकता है

D. शायद

E. निश्चित-रूप से हाँ

F. नहीं जानते

410) Do you believe that kerosene lighting is bad for your health?

A. Definitely not

B. Probably not

C. Maybe

D. Probably

E. Definitely

F. Don't know

क्या आप मानते हो कि मिट्टी के तेल से रोशनी आपकी सेहत के लिए ख़राब है?

A. निश्चित-रूप से नहीं

B. शायद नहीं

C. हो सकता है

D. शायद

E. निश्चित-रूप से हाँ

F. नहीं जानते

411) Have you ever been victim of a kerosene fire? 1 Yes 0 No

क्या आप घर में कभी मिट्टी के तेल से आग लगी है? 1 हाँ 0 नहीं

412) Do you know someone who has been victim of a kerosene fire? 1 Yes 0 No

क्या आप किसी ऐसे व्यक्ति को जानते हैं जिसके यहाँ मिट्टी के तेल से आग लगी हो? 1 हाँ 0 नहीं

413) At night, is there sufficient lighting for cooking?

A. Definitely not

B. Not really

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

- C. Neutral
- D. Somewhat
- E. Definitively
- F. Don't know

क्या खाना बनाने के लिए रात में पर्याप्त रोशनी होती है?

- A. निश्चित-रूप से नहीं
- B. जरूरी नहीं
- C. ठीक-ठाक
- D. कुछ हद तक
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

414) Do you feel safe going outside at night?

- A. Definitively not
- B. Not really
- C. Neutral
- D. Somewhat
- E. Definitively
- F. Don't know

क्या आप रात में बाहर जाते हुए सुरक्षित महसूस करते हैं?

- A. निश्चित-रूप से नहीं
- B. जरूरी नहीं
- C. ठीक-ठाक
- D. कुछ हद तक
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

415) Would you feel safer if there was more light?

- A. Definitively not
- B. Not really
- C. Neutral
- D. Somewhat
- E. Definitively
- F. Don't know

यदि ज्यादा रोशनी हो तो क्या आप ज्यादा सुरक्षित महसूस करेंगे?

- A. निश्चित-रूप से नहीं
- B. जरूरी नहीं
- C. ठीक-ठाक
- D. कुछ हद तक
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

416) Overall, how satisfied are you with your lighting?

- A. Very satisfied
- B. Satisfied
- C. Neutral
- D. Unsatisfied

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

### Section 5 Solar Lanterns सोलर- लालटेन

\*\*\*\*\*

*This is the prize you won. [INTERVIEWER GIVES THE SOLAR LANTERN TO THE RESPONDENT.]*

*This is a solar lantern.*

यह आपका उपहार है जो आपने जीता है [साक्षात्कारकर्ता उत्तरदाता को सोलर लालटेन दीजिये]

यह एक सोलर लालटेन है.

500) Does someone in your household already own a solar lantern? 1 Yes 0 No

क्या आपके घर में किसी के पास पहले से सोलर लालटेन है? 1 हाँ 0 नहीं

501) Has someone in your household ever had a solar lantern in the past? 1 Yes 0 No

क्या आपके घर में कभी किसी के पास पहले सोलर लालटेन थी? 1 हाँ 0 नहीं

502) Had you seen a solar lantern before? 1 Yes 0 No

क्या आपने सोलर लालटेन पहले देखी थी? 1 हाँ 0 नहीं

502a) If yes, where did you see one?

- A. Demonstration by company
- B. Household use in your village
- C. Household use in other village
- D. Town or city
- E. Media
- F. Other (specify) \_\_\_\_\_

यदि हाँ, तो कहाँ देखी थी?

- A. कंपनी द्वारा प्रदर्शन के दौरान
- B. आपके गाँव में घर में इस्तेमाल के दौरान
- C. दूसरे गाँव में घर में इस्तेमाल के दौरान
- D. शहर या कस्बे में
- E. अखबार या टीवी के विज्ञापन में
- F. अन्य(उल्लेख करें) \_\_\_\_\_

503) Do you know someone with a solar lantern? 1 Yes 0 No

क्या आप किसी को जानते हो जिसके पास सोलर लालटेन है? 1 हाँ 0 नहीं

504) How often do you have a conversation with this person?

- A. more than three times a week
- B. once a week
- C. once a month
- D. once a year

इस व्यक्ति से आप कितनी बार बातचीत करते हो?

- A. एक सप्ताह में 3 बार से ज्यादा
- B. सप्ताह में एक बार
- C. महीने में एक बार
- D. साल में एक बार

505) Who in your household do you think will mostly be using the solar lantern?

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

- A. Myself
- B. My spouse
- C. My children
- D. No one
- E. Other

आपके हिसाब से आपके घर में सोलर लालटेन का इस्तेमाल सबसे ज्यादा कौन करेगा?

**[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]**

- A. स्वयं
- B. मेरा जीवन-साथी
- C. मेरे बच्चे
- D. कोई नहीं
- E. अन्य

506) What do you think the lantern will be used for? [CHECK ALL THAT APPLY]

- A. Business
- B. Studying
- C. Cooking, cleaning, laundry
- D. Meeting with friends and family
- E. Other (specify) \_\_\_\_\_

आपके हिसाब से सोलर लालटेन का इस्तेमाल किस चीज के लिए होगा/करेंगे? [जो-जो लागू हो उसे दर्ज करें]

**[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]**

- A. व्यापार
- B. पढ़ाई
- C. खाना बनाना, साफ-सफाई, कपड़े की धुलाई
- D. परिवार और दोस्तों के साथ बैठकी

अन्य(उल्लेख करें) \_\_\_\_\_

507) Do you think a solar lantern can function properly without many maintenance problems? 1 Yes 0 No

क्या आपके हिसाब से सोलर लालटेन रख-रखाव की ज्यादा समस्या के बिना अच्छी तरह से काम कर सकती है? 1 हाँ 0 नहीं

508) How much would you say this solar lantern costs? \_\_\_\_\_ rupees

आपके हिसाब से इस सोलर लालटेन की कितनी कीमत होगी? \_\_\_\_\_ रूपए

509) Do you think that the solar lantern is an innovative product?

- A. Definitely not
- B. Not really
- C. Neutral
- D. Somewhat
- E. Definitely
- F. Don't know

क्या आप ऐसा सोचते हो कि सोलर लालटेन एक नई किस्म की (उन्नतिशील) चीज है?

- A. निश्चित-रूप से नहीं
- B. जरूरी नहीं
- C. ठीक-ठाक
- D. कुछ हद तक
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

509) Would you say that a solar lantern is a superior product compared to a kerosene lamp?

- G. Definitely not
- H. Not really
- I. Neutral

### Section 3 BDM Game सेक्शन 3 BDM गेम

\*\*\*\*\*

[INTERVIEWER SHOWS HOW THE SOLAR LANTERN WORKS.]

This is a solar-powered light source. We are offering you today an opportunity to obtain it. Let me explain how it works. To charge this lantern fully, it needs to be exposed to sunlight during the day. Then, the lantern works up to 8 hours. You can use it for reading, cooking or other household activities. We are interested to know how much you would pay for this product. For this, we will play a short game.

I am going to ask you how much you are willing to pay for the lantern, and depending on the outcome of the game, you might or not be able to buy this lantern. It goes like this: you first make a bid, and then you can randomly draw a ball from this cup. The balls in the cup are distributed in increments of \$0.5 (convert in Rupees), from amount 0 to amount \$8, in equal proportion (i.e. there is one ball marked with each number of 0, 0.5, 1, 1.5, ..., 7.5, 8).

If the price on the ball you draw is higher than your bid, you won't be able to purchase the good.

If the price on the ball you draw is lower than your bid, you will purchase the lantern at the price you have drawn.

When you make your bid, make sure you have access to the funds. You do not have to present the money when you bid.

You are permitted to gather the money by the end of that day. It is important to remember that you will have only one chance to play, that you cannot change your bid after drawing from the cup and that you must be able to pay that day.

[साक्षात्कारकर्ता दिखाएँ कि सोलर लैंटर्न कैसे काम करती है]

यह सोलर पॉवर से चलने वाला प्रकाश श्रोत है. हम आपको आज इस लैंटर्न को प्राप्त करने का मौका दे रहे हैं. मैं आपको बताता हूँ कि यह कैसे काम करती है. इसे पूरी तरह से चार्ज करने के लिए, दिन में इसे सूरज की रोशनी में रखना पड़ता है. इसके बाद लैंटर्न 8 घंटे तक काम करती है. इसे आप पढ़ने, खाना बनाने और घर के दूसरे कामों में इस्तेमाल कर सकते हैं. हम यह जानना चाहते हैं कि आप इसकी कितनी कीमत दे सकते हैं. यह जानने के लिए हम एक छोटा सा खेल खेलेंगे.

मैं आपसे जानना चाहूँगा कि आप इस लैंटर्न के लिए कितना भुगतान कर सकते हैं, और खेल के अंत में, आप इस लैंटर्न को ले सकेंगे या नहीं ले सकेंगे. ये इस तरह होगा: आपको पहले एक बोली लगनी होगी, और इसके बाद इस कप से आप एक गेंद उठाएंगे. इस कप में गेंदें 30 रुपये के बढ़ते हुए क्रम में हैं जो 0 से शुरू होकर 480 तक हैं. (यहाँ पर हर एक गेंद को 0, 30, 60, 90, ..., 480 नंबर दिया जायेगा).

साक्षात्कारदाता से पूछें कि वे सोलर लैंटर्न के लिए कितना खर्च कर सकते हैं. उन्हें याद दिलाइये कि यदि वे बोली से ज्यादा पैसे वाली गेंद चुनेंगे, तो वे सोलर लैंटर्न खरीद नहीं पाएंगे. यदि वे बोली से कम पैसे वाली गेंद चुनेंगे, तो वे सोलर लैंटर्न खरीद पाएंगे. वे पैसे लगाने से पहले एक बार अपनी बोली में बदलाव कर सकते हैं.

जब आप बोली लगायें, आप उतने पैसे होने चाहिए. हलाकि बोली के समय आपको पैसे देने की जरूरत नहीं है.

आपको दिन खत्म होने तक पैसे इकट्ठे करने की अनुमति. इस बात पर जोर दीजिये कि साक्षात्कारदाता के पास सिर्फ एक बार खेलने का मौका है, एक बार गेंद चुनने के बाद आप अपनी बोली में बदलाव नहीं कर सकते और दिन के अंत में आपके पास पैसे होने चाहिए.

## PRACTICE ROUND

Let's just have a practice round with this bar of soap. [INTERVIEW SHOWS BAR OF SOAP]

What is your maximum willingness to pay for this bar soap?

WAIT FOR A REPLY BUT DO NOT RECORD.

Do you have access to these funds?

Also, remember that if you draw slightly more than your bid, you will not be able to purchase the soap.

Do you wish to readjust your bid?

ALLOW THE RESPONDENT TO ADJUST THE BID.

REPEAT THIS PROCESS UNTIL THE FINAL BID IS ESTABLISHED.

BEFORE DRAWING, REVIEW DIFFERENT HYPOTHETICAL OUTCOMES TO TEST THE RESPONDENT'S UNDERSTANDING.

### अभ्यास राउंड

साबुन की टिकिया के साथ एक एक राउंड अभ्यास कर लेना चाहिए (साक्षात्कारकर्ता साबुन की टिकिया दिखाएँ)

इस साबुन को खरीदने के लिए आपकी अधिकतम बोली क्या है?

उत्तर का इंतजार कीजिये, लेकिन इसको दर्ज मत कीजिये.

क्या आपके पास बोली में लगाये गए रूपए की व्यवस्था है?

और ये भी याद रखिये कि यदि आपके द्वारा निकाली गई गेंद की कीमत, आपकी बोली से थोड़ी भी ज्यादा है तो आप साबुन की टिकिया नहीं खरीद पाओगे.

क्या आप अपनी बोली में कोई बदलाव करना चाहेंगे?

उत्तरदाता को बोली में बदलाव करने का मौका दीजिये.

उपरोक्त प्रक्रिया को दोहराइये जब तक कि अंतिम बोली फाइनल न हो जाये.

गेंद निकाले जाने से पहले, उत्तरदाता की समझ को विभिन्न महसूस किये गए परिणाम के आधार पर परखिये.

300) Your final bid is: \_\_\_\_\_ RUPEES

LET THE RESPONDENT DRAW A BALL FROM THE CUP.

आपकी अंतिम बोली है \_\_\_\_\_ रूपए (उत्तरदाता को कप से गेंद निकालने दीजिये)

301) The price you have drawn is: \_\_\_\_\_ RUPEES

IF THE PRICE ON THE BALL IS LOWER THAN THE BID, THE RESPONDENT WOULD BUY THE SOAP.

IF THE PRICE ON THE BALL IS HIGHER THAN THE BID, THE RESPONDENT COULD NOT PURCHASE THE GOOD.

आपके द्वारा निकाली गई गेंद की कीमत है \_\_\_\_\_ रूपए

(यदि गेंद की कीमत बोली से कम है तो उत्तरदाता साबुन खरीद सकेगा)

(यदि गेंद की कीमत बोली से ज्यादा है तो उत्तरदाता साबुन नहीं खरीद सकेगा)

### REAL GAME

Let's now play for real:

What is your maximum willingness to pay for this solar lantern?

WAIT FOR A REPLY BUT DO NOT RECORD.

Do you have access to these funds?

Also, remember that if you draw slightly more than your bid, you will not be able to purchase the solar lantern.

Do you wish to readjust your bid?

ALLOW THE RESPONDENT TO ADJUST THE BID.

REPEAT THIS PROCESS UNTIL THE FINAL BID IS ESTABLISHED.

BEFORE DRAWING, REVIEW DIFFERENT HYPOTHETICAL OUTCOMES TO TEST THE RESPONDENT'S UNDERSTANDING.

### वास्तविक खेल

अब हमको सच में खेल खेलना चाहिए

सोलर लैंटर्न को खरीदने के लिए आपकी अधिकतम बोली क्या है?

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

उत्तर का इंटरजॉर को जिये, लेकिन इसको दर्ज मत कीजिये:

क्या आपके पास बोली में लगाये गए रूपए की व्यवस्था है?

और ये भी याद रखिये कि यदि आपके द्वारा निकाली गई गेंद की कीमत, आपकी बोली से थोड़ी भी ज्यादा है तो आप सोलर लैंटर्न नहीं खरीद पाओगे.

क्या आप अपनी बोली में कोई बदलाव करना चाहेंगे?

उत्तरदाता को बोली में बदलाव करने का मौका दीजिये.

उपरोक्त प्रक्रिया को दोहराहिये जब तक कि अंतिम बोली फाइनल न हो जाये.

गेंद निकाले जाने से पहले, उत्तरदाता की समझ को विभिन्न महसूस किये गए परिणाम के आधार पर परखिये.

302) Your final bid is: \_\_\_\_\_ RUPEES

LET THE RESPONDENT DRAW A BALL FROM THE CUP.

आपकी अंतिम बोली है \_\_\_\_\_ रूपए (उत्तरदाता को कप से गेंद निकालने दीजिये)

303) The price you have drawn is: \_\_\_\_\_ RUPEES

IF THE PRICE ON THE BALL IS LOWER THAN THE BID, PROCEED TO THE PURCHASE.

IF THE PRICE ON THE BALL IS HIGHER THAN THE BID, THE RESPONDENT CANNOT PURCHASE THE GOOD.

आपके द्वारा निकाली गई गेंद की कीमत है \_\_\_\_\_ रूपए

(यदि गेंद की कीमत बोली से कम है तो उत्तरदाता लैंटर्न खरीद सकेगा)

(यदि गेंद की कीमत बोली से ज्यादा है तो उत्तरदाता लैंटर्न नहीं खरीद सकेगा)

- C. गड़ढे वाला शौचालय  
D. उन्नत हवादार गड़ढे वाला शौचालय  
E. अन्य: \_\_\_\_\_

403) What is the household's main source of drinking water?

- A. Piped water inside dwelling  
B. Private outside standpipe/tap  
C. Public standpipe /tap  
D. Neighbouring household  
E. Water vendor  
F. Water truck/ tanker service  
G. Well with pump  
H. Well without pump  
I. River, lake, spring, pond  
J. Rainwater  
K. Other

403) इस घर का पीने के पानी का मुख्या श्रोत क्या है?

- A. घर के अन्दर ही पाइप वाला पानी  
B. निजी बाहरी पानी की टंकी  
C. सरकारी पानी की टंकी  
D. पड़ोसी का घर  
E. फेरी वाला पानी  
F. पानी के ट्रक या टैंकर की सेवा  
G. पंप के साथ कुआँ  
H. बिना पंप का कुआँ  
I. नदी, झील, झरना, तालाब  
J. बरसाती पानी  
K. अन्य \_\_\_\_\_

404) Do you own your home? 1 Yes 0 No

क्या आपका अपना घर है? 1 हाँ 0 नहीं

405) How much land do you own? \_\_\_\_\_ [ACRES – check if local unit]

आपके पास कितनी जमीन है? \_\_\_\_\_ (एकड़)

406) How much irrigated land do you own? \_\_\_\_\_ [ACRES – check if local unit]

आपके पास कितनी सिंचित जमीन है? \_\_\_\_\_ (एकड़)

407) Do you own cattle? 1 Yes 0 No

क्या आपके पास जानवर हैं? 1 हाँ 0 नहीं

408) Do you own a cookstove? 1 Yes 0 No

क्या आपके पास खाना बनाने वाला चूल्हा है? 1 हाँ 0 नहीं

409) If yes, which type of fuel do you use for the cookstove?

- A. Firewood      B. Crop residue      C. Cowdung cake      E. Coal, lignite, charcoal  
F. Kerosene      G. LPG      H. Electricity      I. Biogas      J. Other: \_\_\_\_\_

यदि हाँ, तो चूल्हे के लिए किस तरह का इंधन उपयोग करते हैं?

- A. जलौनी लकड़ी      B. फसल के अवशेष      C. गोबर का कंड़ा      E. कोयला  
F. मिट्टी का तेल      G. एल.पी.जी.      H. बिजली      I. बायोगैस      J. अन्य: \_\_\_\_\_

410) Do you own a radio?      1 Yes 0 No

क्या आपके पास रेडियो है?      1 हाँ      0 नहीं

411) Do you own a mobile phone?      1 Yes 0 No

क्या आपके पास मोबाइल फ़ोन है?      1 हाँ      0 नहीं

412) Do you own a watch?      1 Yes 0 No

क्या आपके पास घड़ी है?      1 हाँ      0 नहीं

413) Do you own a fan?      1 Yes 0 No

क्या आपके पास पंखा है?      1 हाँ      0 नहीं

414) Do you own a sofa?      1 Yes 0 No

क्या आपके पास सोफा है?      1 हाँ      0 नहीं

\*\*\*\*\*  
**Section 5 Lighting रोशनी**  
\*\*\*\*\*

500) Does your household have any electricity?      1 Yes 0 No

क्या आपके घर में किसी तरह की बिजली है?      1 हाँ      0 नहीं

501) Do you use any artificial lighting?      1 Yes 0 No

क्या आप कोई कृत्रिम रोशनी का इस्तेमाल करते हैं?      1 हाँ      0 नहीं

502) Which of the following do you primarily use for lighting?

- A. Kerosene lamps      1 Yes 0 No  
B. Candles      1 Yes 0 No  
C. Battery charged lamps      1 Yes 0 No  
D. Solar-powered lamps      1 Yes 0 No  
E. Firewood      1 Yes 0 No  
F. Grid electricity      1 Yes 0 No  
G. Other (specify): \_\_\_\_\_

रोशनी के लिए मुख्य रूप से इनमे से आप क्या इस्तेमाल करते हैं?

- A. मिट्टी के तेल का लैंप      1 हाँ      0 नहीं  
B. मोमबत्तियां      1 हाँ      0 नहीं  
C. बैटरी से चार्ज होने वाला लैंप      1 हाँ      0 नहीं  
D. सूरज की रोशनी से चार्ज होने वाला लैंप      1 हाँ      0 नहीं

- E. जलाना लकड़ी 1 हाँ 0 नहीं  
F. सरकारी बिजली 1 हाँ 0 नहीं  
G. अन्य(उल्लेख कीजिये) \_\_\_\_\_

503) How many kerosene lamps do you own? \_\_\_\_\_ lamps  
आपके पास कितने मिट्टी के तेल वाले लैंप हैं? \_\_\_\_\_ लैंप

504) What type of kerosene lamps do you have?

- A. Kerosene lamp with no cover 1 Yes 0 No  
B. Kerosene lamp with glass cover 1 Yes 0 No  
C. Pressurized kerosene lamp 1 Yes 0 No

आपके पास किस तरह का मिट्टी के तेल वाला लैंप है?

- A. बिना कवर के मिट्टी के तेल का लैंप 1 हाँ 0 नहीं  
B. शीशे वाले कवर के साथ मिट्टी के तेल का लैंप 1 हाँ 0 नहीं  
C. मिल्टन वाला मिट्टी के तेल का लैंप 1 हाँ 0 नहीं

505) What does your household use lighting for? [CHECK ALL THAT APPLY]

- A. Business  
B. Studying  
C. Cooking, cleaning, laundry  
D. Meeting with friends and family  
E. Other (specify) \_\_\_\_\_

आपका घर किस लिए रोशनी का इस्तेमाल करता है? [जो-जो लागू हो उसे दर्ज करें]

- A. व्यापार  
B. पढाई-लिखाई  
C. खाना-बनाना, सफाई, कपड़ा धुलाई  
D. परिवार और दोस्तों संग बैठकी में  
E. अन्य(उल्लेख करें) \_\_\_\_\_

506) Do your children also use lighting? 1 Yes 0 No

क्या आपके बच्चे भी रोशनी का इस्तेमाल करते हैं? 1 हाँ 0 नहीं

507) If yes, do they use it for studying? 1 Yes 0 No

यदि हाँ, तो क्या इसका इस्तेमाल पढाई के लिए करते हैं? 1 हाँ 0 नहीं

508) On average, how many hours of artificial lighting do you have a day? \_\_\_\_\_ HOURS

एक दिन में औसतन कितने घंटे कृत्रिम रोशनी का इस्तेमाल करते हैं? \_\_\_\_\_ घंटे

509) How many rupees per month do you spend on lighting fuel?

- A. Electricity \_\_\_\_\_ RUPEES  
B. Kerosene \_\_\_\_\_ RUPEES  
C. Battery charged lamps \_\_\_\_\_ RUPEES

रोशनी के लिए ईंधन पर हर महीने आप कितना खर्च करते हैं?

- A. बिजली पर \_\_\_\_\_ रुपए  
B. मिट्टी के तेल पर \_\_\_\_\_ रुपए

C. बैटरी से चार्ज होने वाले लैप पर \_\_\_\_\_ रूप

510) Do you believe your current lighting solution is bad for your eyesight?

- A. Definitely not
- B. Probably not
- C. Maybe
- D. Probably
- E. Definitely
- F. Don't know

क्या आप ऐसा मानते हो कि आपके घर में रोशनी की जो व्यवस्था है वह आपकी आँखों के लिए नुकसान दायक है

- A. निश्चित-रूप से नहीं
- B. शायद नहीं
- C. हो सकता है
- D. शायद
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

511) Do you believe that kerosene lighting is bad for your health?

- A. Definitely not
- B. Probably not
- C. Maybe
- D. Probably
- E. Definitely
- F. Don't know

क्या आप मानते हो कि मिट्टी के तेल से रोशनी आपकी सेहत के लिए ख़राब है?

- A. निश्चित-रूप से नहीं
- B. शायद नहीं
- C. हो सकता है
- D. शायद
- E. निश्चित-रूप से हाँ
- F. नहीं जानते

512) Have you ever been victim of a kerosene fire? 1 Yes 0 No

क्या आप घर में कभी मिट्टी के तेल से आग लगी है? 1 हाँ 0 नहीं

513) Do you know someone who has been victim of a kerosene fire? 1 Yes 0 No

क्या आप किसी ऐसे व्यक्ति को जानते हैं जिसके यहाँ मिट्टी के तेल से आग लगी हो? 1 हाँ 0 नहीं

514) At night, is there sufficient lighting for cooking?

- A. Definitely not
- B. Not really
- C. Neutral
- D. Somewhat

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

E. Definitely

F. Don't know

क्या खाना बनाने के लिए रात में पर्याप्त रोशनी होती है?

A. निश्चित-रूप से नहीं

B. जरूरी नहीं

C. ठीक-ठाक

D. कुछ हद तक

E. निश्चित-रूप से हाँ

F. नहीं जानते

515) Do you feel safe going outside at night?

A. Definitely not

B. Not really

C. Neutral

D. Somewhat

E. Definitely

F. Don't know

क्या आप रात में बाहर जाते हुए सुरक्षित महसूस करते हैं?

A. निश्चित-रूप से नहीं

B. जरूरी नहीं

C. ठीक-ठाक

D. कुछ हद तक

E. निश्चित-रूप से हाँ

F. नहीं जानते

516) Would you feel safer if there was more light?

A. Definitely not

B. Not really

C. Neutral

D. Somewhat

E. Definitely

F. Don't know

यदि ज्यादा रोशनी हो तो क्या आप ज्यादा सुरक्षित महसूस करेंगे?

A. निश्चित-रूप से नहीं

B. जरूरी नहीं

C. ठीक-ठाक

D. कुछ हद तक

E. निश्चित-रूप से हाँ

F. नहीं जानते

517) Overall, how satisfied are you with your lighting?

A. Very satisfied

B. Satisfied

C. Neutral

D. Unsatisfied

E. Very unsatisfied

कुल-मिलाकर, आप अपनी राशनी की व्यवस्था से कितना संतुष्ट हैं?

- A. बहुत संतुष्ट
- B. संतुष्ट
- C. ठीक-ठाक
- D. असंतुष्ट
- E. बहुत असंतुष्ट

\*\*\*\*\*

### Section 6 Solar Lanterns सोलर- लालटेन

\*\*\*\*\*

600) Does someone in your household already own a solar lantern? 1 Yes 0 No

क्या आपके घर में किसी के पास पहले से सोलर लालटेन है? 1 हाँ 0 नहीं

601) Has someone in your household ever had a solar lantern in the past? 1 Yes 0 No

क्या आपके घर में कभी किसी के पास पहले सोलर लालटेन थी? 1 हाँ 0 नहीं

602) Had you seen a solar lantern before? 1 Yes 0 No

क्या आपने सोलर लालटेन पहले देखी थी?

602a) If yes, where did you see one?

- A. Demonstration by company
- B. Household use in your village
- C. Household use in other village
- D. Town or city
- E. Media
- F. Other (specify) \_\_\_\_\_

यदि हाँ, तो कहाँ देखी थी?

- A. कंपनी द्वारा प्रदर्शन के दौरान
- B. आपके गाँव में घर में इस्तेमाल के दौरान
- C. दूसरे गाँव में घर में इस्तेमाल के दौरान
- D. शहर या कस्बे में
- E. अखबार या टीवी के विज्ञापन में
- F. अन्य(उल्लेख करें) \_\_\_\_\_

603) Do you know someone with a solar lantern? 1 Yes 0 No

क्या आप किसी को जानते हो जिसके पास सोलर लालटेन है? 1 हाँ 0 नहीं

604) How often do you have a conversation with this person?

- A. more than three times a week
- B. once a week
- C. once a month
- D. once a year

इस व्यक्ति से आप कितनी बार बातचीत करते हो?

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

- A. एक सप्ताह में 3 बार से ज्यादा  
B. सप्ताह में एक बार  
C. महीने में एक बार  
D. साल में एक बार

**605) Who in your household do you think will/would mostly be using the solar lantern?**

[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]

- A. Myself  
B. My spouse  
C. My children  
D. No one  
E. Other

आपके हिसाब से आपके घर में सोलर लालटेन का इस्तेमाल सबसे ज्यादा कौन करेगा?

[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]

- A. स्वयं  
B. मेरा जीवन-साथी  
C. मेरे बच्चे  
D. कोई नहीं  
E. अन्य

**606) What do you think the lantern will/would be used for? [CHECK ALL THAT APPLY]**

[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]

- A. Business  
B. Studying  
C. Cooking, cleaning, laundry  
D. Meeting with friends and family  
E. Other (specify) \_\_\_\_\_

आपके हिसाब से सोलर लालटेन का इस्तेमाल किस चीज के लिए होगा/करोगे? [जो-जो लागू हो उसे दर्ज करें]

[USE 'WILL' IF THEY ARE BUYING THE LANTERN, 'WOULD' IF NOT.]

- A. व्यापार  
B. पढ़ाई  
C. खाना बनाना, साफ-सफाई, कपड़े की धुलाई  
D. परिवार और दोस्तों के साथ बैठकी  
E. अन्य(उल्लेख करें) \_\_\_\_\_

**607) Do you think a solar lantern can function properly without many maintenance problems? 1 Yes 0 No**

क्या आपके हिसाब से सोलर लालटेन रख-रखाव की ज्यादा समस्या के बिना अच्छी तरह से काम कर सकती है? 1 हाँ 0 नहीं

**608) How much would you say this solar lantern costs? \_\_\_\_\_ rupees**

आपके हिसाब से इस सोलर लालटेन की कितनी कीमत होगी? \_\_\_\_\_ रूपए

**609) Do you think that the solar lantern is an innovative product?**

- A. Definitely not  
B. Not really  
C. Neutral

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

## Section 10 - Risk Aversion

\*\*\*\*\*

“Suppose you are given two options of receiving income. In the first option you are guaranteed  $X$  rupees per month. In the second option you are guaranteed  $Y$  or  $Z$  rupees, each with equal chance. Which option would you choose?”

	Option A	Option B	
1001	Win 3000 Rp for sure	50% of winning 3000 or 50% of winning 6000	If A chosen, exit game. Risk averse
1002	Win 3000 for sure	50% of winning 1500 or 50% of winning 6000	If A chosen, offer option 3. If B chosen, offer option 4.
1003	Win 3000 for sure	50% of winning 2250 or 50% of winning 6000	If A chosen risk A=4 If B chosen risk A=3

This is the author's accepted manuscript without copyediting, formatting, or final corrections.

It will be published in its final form in an upcoming issue of EDCC, published by The University of Chicago Press.

Include the DOI when citing or quoting: <https://doi.org/10.1086/714115>. Copyright 2021 The University of Chicago Press.

1004	Win 3000 for sure	50% of winning 750 or 50% of winning 6000	If A chosen risk A=2 If B chosen risk A=1
------	-------------------	--	--

“मान लीजिये आपको पैसा प्राप्त करने के दो विकल्प दिए जाते हैं। पहले विकल्प में आपको निश्चित तौर पर  $X$  रुपये मिलेंगे। दूसरे विकल्प में निश्चित तौर या तो  $Y$  रुपये मिलेंगे या  $Z$  रुपये, और दोनों के आने के सामान अवसर हैं। आप कौन सा विकल्प चुनेंगे?”

	विकल्प A	विकल्प B	
1001	3000 रुपये निश्चित तौर पर	3000 रुपये या 6000 रुपये जीतने के 50-50 प्रतिशत अवसर	यदि A चुना खेल समाप्त करें
1002	3000 रुपये निश्चित तौर पर	1500 रुपये या 6000 रुपये जीतने के 50-50 प्रतिशत अवसर	A चुनने पर उत्तरदाता को तीसरा विकल्प दें. B चुनने पर उत्तरदाता को चौथा विकल्प दें.
1003	3000 रुपये निश्चित तौर पर	2250 रुपये या 6000 रुपये जीतने के 50-50 प्रतिशत अवसर	यदि A चुना रिस्क A=4 यदि B चुना रिस्क A=3
1004	3000 रुपये निश्चित तौर पर	750 रुपये या 6000 रुपये जीतने के 50-50 प्रतिशत अवसर	यदि A चुना रिस्क A=2 यदि B चुना रिस्क A=1
